Hi all,

I tried to compile an app skeleton based on the use of mysql 5.0 under MINGW. Following the indications already published on UPP forum, I added paths to MYSQL Server directories (path, include and lib) to the Build environment and to the MYSQL.h header file. All the ISO and related error to mysql types disappear but there is still one error remaining :

```
DBPrjMain.cpp
DBProject: 1 file(s) built in (0:04.23), 4234 msecs / file, duration = 4250 msecs, parallelization 0%
Linking...
D:\logiciels\dvt\ultimate\mingw\bin\ld.exe: cannot find -lmysql
collect2: ld returned 1 exit status
```

There were errors. (0:07.48)

Is anybody have an idea about it ?

Thanks in advance for help

Kind regards

Biobytes

The linker is looking for the library file from the mysql 5 installation. For MINGW: libmysql.a/libmysql.so, for MSC: mysql.lib/mysql.dll. You will have to make sure your lib path from TheIDE settings can see the library files or to specify -ldirectory as extra parameter to the linker.

I has solved this problem under Win XP by Installing MS Visio C++ 2005 and then autoconfig TheIDE (check include paths - mysql include must be in list). (I can compile ONLY in DEBUG mode).

Under MINGW - problem are stay.

Maybe anybody know how to compile mysql under MinGW. (Step By Step).

Maybe ask Mirek to include some version of mysql's mingw lib files to Uppsrc as package (or upload ready to compile package to some site).

Thanks both of you for your reply. I have added libmysql.a to the Mingw bin directory and all is compiling without any error. But as soon as I declare an object like :

```
private:  
    MySqlSession DBprj;
```

I get a compiler error like "MySqlSession does not have a name type". This is very similar the error obtained when you try to compile an app based on OleDb with MINGW compiler (I have understood that in that case a MSC must be used). But what about mySql?

If I suppress the MySqlSession object, no error is happening.

Please could you comment ?

Thank you again for your advices

Best regards

That's strange.  
whats the exact error output?

Hi CaptainC and Sergey,

I have added all the information related to the compiling issue in the attached zipped file.

Why I do not understand is that all seems to go the right way and then just have a "does not name type" error at the final step. I have also joined the Build config and the file header that contains the MySqlConnection object.

I wonder if there could be a problem with the MYSQL version (I use 5.1) and the version of the libmysql.a library.

Hoping that could be helpful,

Kind regards

this code are working

```
MySqlConnection session;  
if(!session.Connect(app.mysql_username, app.mysql_password, app.mysql_database,  
app.mysql_server)) {  
    printf("Can't connect with MySql\n");  
    PromptOK(t_("Can't connect with MySql"));  
    return;  
}  
mysql_set_character_set(session, "utf8");  
  
SQL = session;  
Sql sql(session);
```

under linux (ubuntu 8.04 - compiler GCC) and  
under windows (XP - compiler Visual Studio 2005)

Thanks you Sergey for your comments and help.

I will download VC++ studio express this weekend and try to compile my code according to your template. I will back to the forum to confirm if it works.

Best regards

Quote:I wonder if there could a problem with the MYSQL version (I use 5.1) and the version of the libmysql.a library.  
Just make sure the headers and the compiled libraries are from the same exact version... otherwise, it should be fine (backwards compatible at least).

Hello,

I've MSVS9 and I need to download the necessary files and libs to work with MySql and U++. The download list at <http://www.mysql.com/downloads/> is a bit confusing for me. What have I to download?

Thanks,  
Luigi

I got the answer. The right download is the package  
mysql-connector-c-6.0.2-win32.msi

to be downloaded from  
<http://www.mysql.com/downloads/connector/c/>

PS: I have just discovered that using  
sql.Execute("...");  
and  
sql.Fetch()  
I can easily replicate all my PHP scripts. Very nice. Upp is a continue discovery
