Hi to all,

Made a tiny code generator for my image dir, thus making the browser an image viewer. Writes a "b.htm" to each dir, also sub-dirs:

http://members.aon.at/amando1957/C++/Imagehtm.zip

One can see here that a tree processor is quite easy to do.

Hints:
- The package has a sub dir "copy_to...". Put the content to your image dir.
- run the proggy with this path.
- start the browser with file "<yourDir>/_see.htm".

I made it fine before, its all done at my harddisk, also the CSS links. But now it prints:
"numFilesCreated = 1"
for any reason (which is much too less,   ).

Martin
