I have some 1-liner function

```
void __fastcall InvertWithMask(WORD &op, WORD mask) {if (op & mask) {op &= ~mask;} else  
{op |= mask;}}
```

and it is completely ignored by Assist++. A bug?

Hello, Paul.

I haven't such issues.

Please see previous definitions of other methods. Errors can be found there.

I found another one:

```
struct Bookmark : Moveable<Bookmark> {  
    String      file;  
    LineEdit::EditPos pos;  
  
    void Serialize(Stream& s)      { s % file % pos; }  
}  
bookmark[10];
```

Quote:

C:\upp\uppsrc\ide\ide.h (620): Missing ;

bookmark[10] doesn't recognized. And the following ff:

```
struct FindInFiles : WithFindInFilesLayout<TopWindow> {  
    WString itext;  
    virtual bool Key(dword key, int count);  
} ff;
```
