I have a question concerning building the package from the sourceforge page.

I don't see any Makefiles, configure scripts, or anything like that. All I find is a set of scripts to create .deb files.

I have downloaded the upp-src-2008.1.tar.gz package.

Any input would be aprectiated.

There is a Makefile in the root of the archive you have downloaded.
This Makefile uses the one located in uppsrc/ide.

Matthias

Hello burlingk

A way to do it is downloading a build from http://www.ultimatepp.org/svnbuilds/

To update it you can download the latest svn source with this command line Quote:svn checkout http://upp-mirror.googlecode.com/svn/trunk/ upp-mirror-read-only
 (svn required). Copy this source in upp-mirror-read-only to upp folder (I think this can be done easier doing menu Project/Svn/Synchronize everything).

Run installed ide, choose uppsrc/ide package and build it. That's it.

Here there is a screenshot.

A funny thing is that you can debug TheIde itself.

Best regards
Koldo
