I propose by default change tab size on resize tabctr;

Need to change code from:

```
TabCtrl::Item& TabDlg::Add0(Ctrl& tab, const char *text)
```

```
{  
    Size tsz = max(tab.GetRect().GetSize(), sz);  
    TabCtrl::Item& m = tabctrl.Add(tab, text);  
    if(tsz != sz) {  
        sz = tsz;  
        Rearrange();  
    }  
    return m;  
}
```

to

```
TabCtrl::Item& TabDlg::Add0(Ctrl& tab, const char *text)
```

```
{  
    Size tsz = max(tab.GetRect().GetSize(), sz);  
    tab.SizePos();  
    TabCtrl::Item& m = tabctrl.Add(tab, text).Slave(&tab);  
    if(tsz != sz) {  
        sz = tsz;  
        Rearrange();  
    }  
    return m;  
}
```

add: code "tab.SizePos();" and ".Slave(&tab)"; It is useful when the TabDlg is sizeable!

Not sure:

Calling SizePos on tab component is quite easy. OTOH, sometimes you might want the tab not to be resized - and doing this, you are loosing this option.

Sorry for stupid question...

How can i do? i tried, but not work:

```
TabDlg dlg;
WithOptionsGeneralLayout<ParentCtrl> tab_options_general;
tab_options_general.SizePos();
dlg.Add(tab_options_general, t_("General")).Slave(&tab_options_general);
```

edit: May be add third parameter, "bool slave = false"?

In TabCtrl.h

```
class TabDlg : public TopWindow {
...
    TabCtrl::Item& Add0(Ctrl& tab, const char *text, bool isslave = false);
...
    TabCtrl::Item& Add(T& tab, const char *text, bool isslave = false)           { CtrlLayout(tab);
return Add0(tab, text, isslave); }
...
    TabDlg& operator()(T& tab, const char *text, bool isslave = false)         { Add(tab, text,
isslave); return *this; }
```

In TabCtrl.cpp

```
TabCtrl::Item& TabDlg::Add0(Ctrl& tab, const char *text, bool isslave)
{
    Size tsz = max(tab.GetRect().GetSize(), sz);
    if(isslave)
        tab.SizePos();

    TabCtrl::Item& m = tabctrl.Add(tab, text);

    if(isslave)
        m.Slave(&tab);

    if(tsz != sz) {
        sz = tsz;
        Rearrange();
    }
    return m;
}
```

...
    TabCtrl::Item& Add(T& tab, const char *text, bool isslave = false)           { CtrlLayout(tab);
return Add0(tab, text, isslave); }
...
    TabDlg& operator()(T& tab, const char *text, bool isslave = false)       { Add(tab, text,
isslave); return *this; }
```

In TabCtrl.cpp

```
TabCtrl::Item& TabDlg::Add0(Ctrl& tab, const char *text, bool isslave)
{
    Size tsz = max(tab.GetRect().GetSize(), sz);
    if(isslave)
        tab.SizePos();

    TabCtrl::Item& m = tabctrl.Add(tab, text);

    if(isslave)
        m.Slave(&tab);

    if(tsz != sz) {
        sz = tsz;
        Rearrange();
    }
    return m;
}
```

OK, I have changed my mind. Original idea is quite ok.

Applied.

Mirek

Thank you for correct changes!
sorry for redundands propouse code ".Slave(&tab);"!
