---

Upp created programs are crashing sometimes with current SVN.

To reproduce, compile reference/Qt4 in debug mode and try running it on a win98 host. It will crash before creating main window.

I tried to localize the problem (using Crash utility) and I think, it is in Upp::FontInfo::Data::GetMetrics, but that code seems to be too complicated to me, to debug without a debugger.

I think, it may be important to some upp users.
