
Subject: Zooming font of RichText to the size of StdFont

[View Forum Message](#) <> [Reply to Message](#)

Do I understand correctly that zoom below will make size of the font of RichText equal to the size of StdFont?

```
Zoom zoom(StdFont().GetHeight(), ScreenDraw(false).GetPixelsPerInch().cy);
```

No.

If I remember well, it should be

```
Zoom(StdFont().GetHeight(), 100);
```

for the default font size, which is 100 dots (pixels).

Anyway, result still does not have to be perfect, because final height and requested height are two different things...

Thanks!

ScreenDraw(false).GetPixelsPerInch().cy returns 96 on all my Windows computers.

Actually, zooming looks better in case of 96. In this case letters do not merge with each other.

Novo wrote on Tue, 06 January 2009 23:20Thanks!

ScreenDraw(false).GetPixelsPerInch().cy returns 96 on all my Windows computers.

It is because it is set as screen property. If you set "Large fonts" in windows screen dialog, it changes to 120dpi (AFAIK).

Really, I have said it before, but people for some strange reason put too much emphasis to this basically meaningless value (GetPixelsPerInch for screen). It is really meaningful only for printer.

GetPixelsPerInch returns 96 even though I have set dpi to 120 in (Desktop) properties -> Settings -> Advanced. I'm using Windows XP. I tried ScreenDraw(false).GetPixelsPerInch().cy and ScreenDraw(false).GetPixelsPerInch().cx

Check

```
void Draw::LoadCaps()
```

- we are only reading info from GDI. If it returns 96, it is because GDI says 96 (IMO).

However, I still insist that this value is basically useless. I guess Win32 guys think the same

I've read about it and it seems to be a Windows XP specific problem with GetDeviceCaps always returning 96. I ended up checking my main window size (it isn't resizable):

```
if(this->GetSize().cx > 690){ //Assume Large font
    DPI = 120;
}
float Multiplier = DPI / 96;
```

I've attached a small testcase which shows my problem. If you load it with 96 dpi all is ok, but when you change it to use 120dpi then you can see the scrollArea StaticText control is not automatically resized and the buttons are no longer of the same size. Basically all the manually added controls are not resized according to the current dpi. How do you guys handle this?

FontZoom.

Check Ctrl::

```
static int HorzLayoutZoom(int cx);
static int VertLayoutZoom(int cy);
```

The basic idea is to query the size of specific text with current default GUI font. Knowing its "default size" (as defined by its size in WinXP with small fonts, but that is hardly relevant) you compute zooming ratio.

Subject: Prompt with non-system dpi for text at first

[View Forum Message](#) <> [Reply to Message](#)

Hello.

On my system I have 108 dpi instead of 96 dpi by default for fonts.

When I use Prompt function before any TopWindow class in the GUI_APP_MAIN with following test case:

```
#include <CtrlLib/CtrlLib.h>
```

```
using namespace Upp;
```

```
GUI_APP_MAIN
```

```
{  
    Zoom z = GetRichTextStdScreenZoom();  
    PromptOK(NFormat("This is a text with Zoom(%d, %d)", z.m, z.d));  
    z = GetRichTextStdScreenZoom();  
    PromptOK(NFormat("This is the same text with Zoom(%d, %d)", z.m, z.d));  
}
```

I have non-system dpi at first activation of the Prompt function.

Before introduction of new Drawing system I didn't have this problem, because U++ application was used system dpi.

Current tested revision is 1724.

I found the following solution for my problem:

```
int Prompt(Callback1<const String&> WhenLink,  
           const char *title, const Image& iconbmp, const char *qtf, bool okcancel,  
           const char *button1, const char *button2, const char *button3,  
           int cx,  
           Image im1, Image im2, Image im3)
```

```

{
+ int bcy = Ctrl::VertLayoutZoom(24);
+ int bcx = Ctrl::HorzLayoutZoom(72);
  int fcy = Draw::GetStdFontCy();
  PromptDlgWnd__ dlg;
  RichTextCtrl qtfctrl;
  Icon      icon;
  qtfctrl.WhenLink = WhenLink;
  icon.SetImage(iconbmp);
  Button b1, b2, b3;
  qtfctrl.SetQTF(String("[G1 "] + qtf, GetRichTextStdScreenZoom()));
- int bcy = Ctrl::VertLayoutZoom(24);
- int bcx = Ctrl::HorzLayoutZoom(72);
  if(button1)
    bcx = max(2 * fcy + GetTextSize(button1, Draw::GetStdFont()).cx, bcx);
  if(button2)
    bcx = max(2 * fcy + GetTextSize(button2, Draw::GetStdFont()).cx, bcx);
  if(button3)
    bcx = max(2 * fcy + GetTextSize(button3, Draw::GetStdFont()).cx, bcx);

```

Its just reordering of control flow. So, Ctrl::Csizeinit() can be initialized before GetRichTextStdScreenZoom().

Thank you for reporting the problem.

I believe even better solution is to put Csizeinit call to GUI_APP_MAIN.

I believe even better solution is to put Csizeinit call to GUI_APP_MAIN.

Thank you for your solution.

Considering new topic I propose following modified solution:

- Make public static Sizenit function to call inlined Csizeinit function.
- Use created Sizenit function in the CtrlCore/Win32Wnd.cpp::InitWin32, CtrlCore/X11App.cpp::InitX11 functions.

Normal diff for 1796 revision:

File: CtrlCore\Ctrl.cpp

770a771,775

> void Ctrl::Sizenit()

> {

> Csizeinit();

> }

Well, I have just removed "inline"...
