Accepts only affects "dotted" flags (like .USESOMETHING).

GUI and MT are always used in "normal" form.

Note that the only reason for "dotted" flags and "accepts" is to reduce compile time and the disk space required for compilation. Everything would work with normal flags, just there would be duplicate identical object files...

yes it's true all works with normal flags but i have huge packages with some config flags and it would reduce build time if i could set GUI and MT as dotted flags.
