Hello all

I have uploaded to bazaar the code and demo to test a function to open and show with Painter static .svg files (Scalable Vector Graphics):

```
void ParseSVG(Painter& p, const char *svg);
```

This is an initial version and it is open to contributions by improving it or by testing it with .svg files.

I have included the next files and folders:

- PainterSvg
  - ParseSvg.cpp: The code
- PainterSvg demo
  - SvgDemo.cpp: The demo (compatible with Painter demo)
  - Examples.h: Rest of files have been taken from Painter demo
  - Examples.lay
  - init
  - main.cpp
  - PainterSvg demo.upp

To open the .svg file copy it in C:\demo.svg or change String file in SvgDemo.cpp.

Before using it please download the last Upp svn.

It has been tested with GCC in Ubuntu/Linux and MinGW/MSVC9 in XP.

Here I enclose you a screenshot.

Best regards

Koldo

Hi,

this might be useful:

[http://www.w3.org/Graphics/SVG/WG/wiki/Test\\_Suite\\_Overview](http://www.w3.org/Graphics/SVG/WG/wiki/Test_Suite_Overview)

I have done following changes:

- 1) Changed the interface: const char \*svg now points to actual SVG text, not to filename (-> you can use other resources than files, while doing LoadFileBOM is simple).
- 2) I have "separated" SvgPainter to package
- 3) I have created SvgView test application that allows you to browse files and view them as .svg.

That said, I have tried this with .svg files from above link and the result is sad. There is a lot of work left to do.

Hello luzr

Yes that is true. Svg format has many options.

For example you can enter a color in at least 5 ways:

- 3-digit hex
- 6-digit hex
- rgb() integer form
- rgb() percentage form
- named ('HTML') colors

and the same for many things.

I can only say that I will continue adding things and if somebody needs to paint certain file not

supported, he/she can send a sample and I will add the necessary for supporting it.

Best regards  
Koldo

Hello all

I have added Image support and changed the function to:

```
void ParseSVG(Painter& p, const char *svg, const char *folder = '\0');
```

as sometimes when the image file name referenced in the svg file is in the svg folder, the folder name is not in the file so we have to give to ParseSVG() the svg folder to search there.

It is also changed the demo to open a FileSel window to search for the svg file. Also there are two samples included.

Best regards  
Koldo

Hello luzr

Perhaps we can remove PainterSvg demo...

Best regards  
Koldo

Hi!

There is a small bug in SvgView. The code should be as following to avoid the partial clipping of images:

```
void SvgView::Load(const char *filename)
{
    img.SetImage(NULL);
    ImageBuffer ib(img.GetSize());
```

Also a bigger bug, the serialization of "files" causes an assert failure.

And something a little bit strange, the pattern used for drawing empty image backgrounds is different on XP and Vista. Is this intentional?

I have started improving SVG compatibility. Right now I'm implementing viewports and other small details and I managed to get two images from on-line SVG spec almost pixel perfect. This is encouraging. On the other hand, my implementation is poor and I'm going to start from scratch with viewports. I'm afraid that I'm going to have to keep in memory all shapes and after computing the bounding box apply scale and translate to achieve correct implementation. Unfortunately, Even SVG Tiny is extremely complicated to get compatible and this without animation. SVG is a devilishly complicated format masquerading as something simple.

The good news is that Firefox has very poor SVG support, so I think we can reach that level with a little effort. Opera is very good on the other hand. Anyway, I just have a few SVGs that I would like to load without modifications.

I have attached a small and very hackish version which almost loads 30 examples from the official test suite. These tests have animation and we don't, but except for this little detail it is pretty much pixel perfect.

It also includes the beginning of a feature that will log all elements that are not understood by the current implementation. This might be useful when someone decides to do full implementation (GSoC 2011? ))

I'm only uploading this as a sample and test; it is not ready for production yet. Also, I need a place to keep a backup .

Here is an updated version of the test packages. I contains a few official test pictures and the compatibility is OK in some cases. It even has extremely primitive animation support that I quickly threw together.

While the compatibility with official test cases has increased, the compatibility with the few pictures included in the original package, like "demo.svg" is zero now.
