Hi,

I had this the code which seems to break the code browser

```
#define std_oper operator
```

```
std::ostream& std_oper << (std::ostream& os, const hash_map<string, string>& h)
{
    for (hash_map<string, string>::const_iterator i = h.begin(); i != h.end(); i++)
    {
        os << ( * i).first << ( * i).second;
    }
    return os;
}
```

If this is insert into a file, then no functions ,etc are listed in goto window after this code...

The problem seems to be caused by std_oper <<

I tested beta1 and current svn...

Well, we do not replace macros (yet).

Mirek
