I have do the change of color, but I don't understand perfectly this solution.

I copied some code, the code is :

```
class RedBackGround : public Display
{
public:
    void Paint(Draw& w, const Rect& r, const Value& value,
               Color ink, Color paper, dword s) const
    {
        Display::Paint(w, r, value, ink, LtRed(), s);
    }
};
```

```
class GreenBackGround : public Display
{
public:
    void Paint(Draw& w, const Rect& r, const Value& value,
               Color ink, Color paper, dword s) const
    {
        Display::Paint(w, r, value, ink, LtGreen(), s);
    }
};
```

and when i want to change color, after a double left click:

```
arrctr_Grid.Set(int_GridPos, Col_Active ,(WString)"N");
arrctr_Grid.SetDisplay(int_GridPos, Col_Active, Single<GreenBackGround>());
```

is not possible do a thing like "arrctr_Grid.GetDisplay(row, col).ChangeColor(Green);
?

thanks

Because Display is very generic solution... It allows you to embed any kind of value and display it correctly.

Anyway, you might be interested in AttrText too - that is a special Value that is interpreted by standard (default) Display.

Mirek

Someone could explain me what exactly "Single<>" do?
And where I can found information about it?
thanks!

Sam
