I was finished first variant of Google Translator in u++.
It seems nice... but i don't know how to resolve:
1. Problems with char encode, (for example when i translate from English to Russian)?
2. Set progress bar on execute http.
3. Integrate user suggestion to improve Google Translator Dictionary!

I can continue to develop:
1. Parse dictionary when i translate only an word.
2. Cash translated terms in xml file.
3. Languages icons.

I attached the source code of GoogleTranslator!

Any ideas is welcome!

I test Google translator on php and it work fine in utf8 encoding!
The function is (this php code is from here):

```php
function translate($str, $from='en', $to='ru'){
 $fp = fsockopen("www.google.com", 80, $errno, $errstr, 30);
 if (!$fp) {
  trigger_error("$errstr ($errno) \n", E_USER_WARNING);
  return "";
 } else {
  $text = "text=".urlencode($str);
  $out = "POST /translate_a/t?client=t&sl=".$from."&tl=".$to." HTTP/1.1\r\n";
  $out .= "Host: www.google.com\r\n";
  $out .= "User-Agent: Mozilla/5.0\r\n";
  $out .= "Accept-Encoding: deflate\r\n";
  $out .= "Content-length: ".strlen($text)."\r\n";
  $out .= "Connection: Close\r\n\r\n";
  $out .= $text;

  fputs($fp, $out);
  $res = "";
  while (!feof($fp)) {
```

```
  $res .= fgets($fp, 1024);
 }
 fclose($fp);
}

$res = explode("\r\n\r\n",$res);
$res = explode("\r\n",$res[1]);
return stripslashes(substr($res[1],1,-1));
}
```

Anybody can help what wrong I did in u++ that i get unknown char encoding?

Subject: Re: Google Translator

View Forum Message <> Reply to Message

The problem with char encoding is resolved! U++ works fine. The problem was in incomplete url address "&ie=utf-8&oe=utf-8";
 Also i was corrected code when compile on linux (thanks to Andrei).

Remain how can I put the progress bar on execute http.

The current source is in attachment.

Depends on how you want it to work. First you should be running the Http request in a Thread so that you can still process Gui messages.

Normally to get a progress bar on an Http request you would just pass in a Gate (the Progress class has an operator for this) that the HttpClient uses to update the progress indicator. Remember to create the Gate outside of the Http thread or it won't work properly (I think).

In your case however, I don't think the amount of data you're recieving is actually large enough to make a progress bar work properly. It will do nothing until connection is established and then update and close almost immediately. I'd suggest faking it with a timer and a looping Progress indicator. Something like:

(Add to header)
 Progress progress;
 String result;
 volatile Atomic translating;

 enum {
  TIMEID_PROGRESS = Ctrl::TIMEID_COUNT,
  TIMEID_COUNT
 };

 void HttpThread(String url, String post, Gate2<int, int> _progress);
 void UpdateProgress();
 bool CheckCancel(int, int);

Source:
void GoogleTranslator::TranslateText(){
 String from = inputwindow.fromlanguagectrl.GetKey(inputwindow.fromlanguagectrl.GetIndex());
 String to = inputwindow.tolanguagectrl.GetKey(inputwindow.tolanguagectrl.GetIndex());
 //... need to add proxy
 //http_client.Proxy("");
 String url = "www.google.com/translate_a/t?client=t&sl=" + from + "&tl=" + to;
 String post = String("text=") << inputwindow.textfrom.GetData();

 progress.Reset();
 progress.SetText("Contacting Google Translator");
 progress.Title("Translating");
 progress.Set(0, 50);

 AtomicWrite(translating, 1);
 SetTimeCallback(-200, THISBACK(UpdateProgress), TIMEID_PROGRESS);
 Thread().Run(THISBACK3(HttpThread, url, post, THISBACK(CheckCancel)));
 while(AtomicRead(translating)) {
  ProcessEvents();
  GuiSleep(300);
 }
 KillTimeCallback(TIMEID_PROGRESS);
 progress.Close();
 textto.Set(result, CHARSET_UTF8);
}

void GoogleTranslator::UpdateProgress()
{
 int p = progress.GetPos() + 1;
 progress.Set((p > progress.GetTotal()) ? 0 : p, progress.GetTotal());
}

bool GoogleTranslator::CheckCancel(int, int)

```
{
 return progress.Canceled();
}

void GoogleTranslator::HttpThread(String url, String post, Gate2<int, int> _progress)
{
 HttpClient http_client;

 http_client.URL(url);
 //http_client.Agent("Mozilla/5.0");
 http_client.TimeoutMsecs(5000);
 http_client.Post();
 http_client.PostData(post);

 result = http_client.ExecuteRedirect(HttpClient::DEFAULT_MAX_REDIRECT,
    HttpClient::DEFAULT_RETRIES, _progress);

 result = Nvl(result
  ,String(", error:")<<Nvl(http_client.GetError(), "")
  <<", status: "<<http_client.GetStatusCode()<<", "<<http_client.GetStatusLine()
  <<", header: "<<http_client.GetHeaders());
 AtomicWrite(translating, 0);
}
```

Thanks! Very useful example!
Maximum amount of data is 32kb. My goal is to understand how can i use progress bar! Thank you!

This example may be add in examples? From this example, new user can learn how to use http client, progress bar and a little threads.

ADD:
In attachment is source code with progress bar!

It's mingw. Using GCC/Mingw temporary variables are always 'const', and the << is a non-const operator.

Just change all the << operators to + and it will work (also in HttpThread)

Subject: Re: Google Translator

Hello tojocky

Nice example. I promise to use it.

One thing I have found is that if in the text to translate there are cr+lf, they are translated as '\' 'r' '\' 'n' letters instead of the cr = \r = ascii 13 and the same for \n.

Best regards
Koldo

Sorry for my delay!
 I was improve a little this project with the following changes:

 - Add proxy settings (address and port)
 - Changed main interface.
 - Add possibility for show program in tray, close in tray, minimize in tray.
 - Save and restore settings
 - Integrate progress bar (many thanks to "mrjt")
 - Show confirmation message box when exit from application.

I was attached the latest version!

In future I would like to add:
 - Possibility for send to google corrected translation by user.
 - Parse translated terms and other specific characters
 - Handle global shortcut events for translation, as in Abby Lingvo
 - Save and restore more settings, as: language from, language to, source text, destination text and other.
 - Make multilingual interface!

If anybody have other ideas or want to contribute, I would be glad!

I do not know how can I handle global events (keyboard for shortcut, mouse)?
Can anybody help me?

Hello everyone!

I was improve a little this project with the following changes:

- Possibility for send to google corrected translation by user.
- Parse translated terms and other specific characters
- Handle global shortcut [Ctrl]+[C]+[C] events for translate copied text, as in Abby Lingvo (only for win32). In this case will translate in baloon from trayicon.
- Save and restore more settings, as: language from, language to, source text.
- Separated core google translate by GUI which named "GoogleTranslator" but demo package I named GoogleTranslatorDemo.
- Corrected errors on mingw and linux (ubuntu 9.04) GCC build
- Correct other errors.
- Added a simple console example to demonstrate google translator
#include <GoogleTranslator/GoogleTranslator.h>

using namespace Upp;

```
CONSOLE_APP_MAIN
{
 String str_status = "";
 GoogleTranslator g_instance;
 Cout() << "Set proxy: 172.16.0.65 , port 3128" << "\n";
 Cout() << "Translate \"translator\" word" << "\n";
 g_instance.SetProxy("172.16.0.65", 3128);
 if(g_instance.Translate("translator", String("en"), String("ro"))){
  Cout() << "Translation: " << g_instance.GetFormatedText() << "\n";
  if(g_instance.GetCorrectionText()!="translator"){
   Cout() << "Send corrected translator if not correct: \"translator\"" << "\n";
   if(g_instance.SetCorrectionText("translator", str_status))
    Cout() << str_status;
  }
 }
}
```

I was attached the latest version!

In future I would like to add:
- Multilingual interface!
- finish global shortcut for x11 and improve for win32.

Ballon message is only for win32, if somebody can add for x11 too I will be glad.

If anybody have other ideas or want to contribute, I would be glad!

Very nice!

Thanks, I will do!

But the main goal is to use GoogleTranslator class in other programs as source code, not only for general translate. For ex. it can be integrated in auto translate of interface.

Hi,

I think Google Translator can be very intersting.

For example how about creating a default translation for an app (if the language is not available) by using Google Translator facility ??

I don't time for this right now but some other person may have it in the future.

Subject: Re: Google Translator

If is any propouses I'm glad to add in GoogleTranslator!

Have a nice day!

Subject: Re: Google Translator
Posted by koldo on Mon, 01 Jun 2009 10:13:43 GMT

Hello tojocky

GoogleTranslator works well for me without proxy, but with proxy it does not.

The program waits for about 10 seconds moving the progress bar in:

```
 result_text = httpClient.ExecuteRedirect(HttpClient::DEFAULT_MAX_REDIRECT,
    HttpClient::DEFAULT_RETRIES, _progress);
```

And after that result_text is filled with

Quote:Error: 171.20.1.44:808: connecting to host timed out,
status: 0,
header:

The proxy address is the same I use in Firefox and IExplorer.
The real port used is 8080 instead of 808, but if I put it the progress bar moves fast some tenths of second and the message I get in result_text is

Quote:Error:HTTP/1.1 407 Proxy Authenti

Perhaps this problem is not due to GoogleTranslator but U++ http client. I cannot answer about this.

Best regards
Koldo

Hello Ion,

thanks for the tool.
I have tried it in WinXP, compiled with MSC9.

I had to change declaration of 2nd function parameter of SetProxyAuth to String (it was int before).

What is not working correctly is translation for multi-line phrases. Translation always stops after first line.

Regards,
Matthias

In configuration I have entered the same proxy data I have in Firefox, that works well.

Perhaps I can try something to try to solve this. Could you give me some advice ?

Best regards
Koldo

Did you check the option "Use HTTP proxy"?
regards, Ion

Hello Ion

Yes. I check "Use HTTP Proxy:" and "Use HTTP Proxy password:" and I fill "Address", "port", "Username" and "Password". This data is the same I use for Internet browser Firefox I use daily.

I have also debugged the program and it does what it seems it have to do. Any additional advice ?

Best regards
Koldo

Hello Koldo,

Try this:
If it is web authorization, I thing that you need first login in Firefox, leave Firefox browser opened and try to translate with GoogleTranslator without option "Use HTTP Proxy password:".

Can you upload screenshots with your firefox proxy settings and user authentication?

Regards,
Ion.

P.S. I thing that your http proxy server do not filter by browser Agent from request packet data.
Now the GoogleTranslator Agent is: "Ultimate++ HTTP clientUltimate++ HTTP client":
 request << "Agent: " << Nvl(agent, "Ultimate++ HTTP client") << "\r\n";

Hello All!

I was changed a little my Google Translator.

Change log:

- in option form when I do not check option "Use HTTP Proxy" set disable proxy address, port, username, password.

Any other suggestions are welcome!

New to do to do item:
 - Set in option form available languages and possibility user add new language. To find needed language in all 80 languages is too boring.

regards,
Ion.

Hello Ion

No success doing this:
Quote:Try this:
If it is web authorization, I thing that you need first login in Firefox, leave Firefox browser opened and try to translate with GoogleTranslator without option "Use HTTP Proxy password:".

I do not know what to do with this.

Quote:P.S. I thing that your http proxy server do not filter by browser Agent from request packet data. Now the GoogleTranslator Agent is: "Ultimate++ HTTP clientUltimate++ HTTP client": request << "Agent: " << Nvl(agent, "Ultimate++ HTTP client") << "\r\n";

Probably the problem does not come from Google Translator but from the U++ http support. Perhaps my proxy is tricky in any way so that Firefox is enough smart to pass it but not U++.

Best regards
Koldo

While trying to compile to check the reported DocEdit bug:

u:\temp.src\googletranslator\GoogleTranslator.h(32) : error C2679: binary '=' : no operator found

which takes a right-hand operand of type 'int' (or there is no acceptable conversio

(password parameter needs to be String)

(password parameter needs to be String)
Thank you Mirek for found error.
Now I updated the latest version to svn! I tested your commend. it seems I already corrected this!

Under UBUNTU is not working.

The program runs but does not translate. In the lower window - silence.

For me working for ubuntu 9.10 and 9.04 with proxy and without proxy!

At work I have Ubuntu 9.04 and connect with proxy.
At home I have 9.10 and work without proxy!

Please use the latest svn version because google changes the format of transfer data!

Regards, Ion (tojocky).

Hello sergeynikitin

For me it works well too (Ubuntu 9.04, no proxy).

Best regards
Koldo

Oooops....

I'll test SVN version tonight.

Hello All!

I post in svn a new version of GoogleTranslatorDemo package. Now when press shortcut Ctrl+C+C will copy unicode text from clickboard. Eg: It's need when translate from russian to romanian!

Regards, Ion Lupascu (tojocky)
