[View Forum Message](#) <> [Reply to Message](#)

Starting today, there should be nightly builds available here:

<http://code.google.com/p/upp-mirror/downloads/list>

For now, there is win32 build and rudimentary src build. I hope to extend and improve the portfolio soon

How about <http://ultimatepp.org/svnbuilds/> ?

I think googlecode hosting is a better option. This all is work in progress, I hope to add .deb builds later to automated system.

Which version of win32 version posted on the google - MINGW with or without?

I suggest this is reflected in the title of the downloadable file.

In fact, I consider canceling Mingw version (though not U++'s ability to use mingw).

I think that providing mingw with U++ causes more trouble than gains...

Thank you luzr

For me that is good as I can update U++ in a system where is not posible for me to use svn.

About MinGW, I think it is good to maintain it in the Windows package as it lets you run the system immediately.

Installing MSC is very automated but more difficult as it is a very big package to download and I have always had to finish installing it in Thelde by hand.

Best regards
Koldo

Then we should fix this, right?

for your information, nightly build packaged can't be use on my windows vista laptop. It says that dbghelp.dll is not a valid win32 library.

By the way, think maintaining version with mingw is very important too.

More info please. 64 or 32 bit Vista?

You could/should also try to replace dbghelp.dll with file from SDK.

Mirek

P.S.: This is exactly why I think nightly builds are so important - to catch issues asap...

OK, it does not work in my XP either

I only wonder why nobody reported the problem yet?

Mirek

Problem identified (these files were simply missing), rerunning the release.

What makes me sad is that this bug was there for a long time apparently and theide could not run with it...

So many downloads and nobody noticed?

Hello luzr

I use svn builds that update with svn and I have never found that problem.

Best regards

Koldo

I have noticed this problem too(at first version). But I just simply(or lazily) copy the dll file (e.g.dbghelp.dll) from mdelfede's BUILD (e.g.http://www.ultimatepp.org/svnbuilds/upp-svn_mingw_SVN.95_1_i386.exe), and it works on my win32 Windows XP. so,....

I guess many people do the same thing as me.

[View Forum Message](#) <> [Reply to Message](#)

I have just tried and everything seems OK.

What include path you needed to add there?

In freshly installed, I have automatically added:

C:\Program Files\Microsoft SDKs\Windows\v6.1\Include

it did not auto detect MS SDK dir (only detected include dir as i remember). do i donno which dir i should configure. VS 9.0

now it's configured to be using

microsoft visual studio 9.0\vc\include

microsoft visual studio 9.0\vc\platformsdk\include

and corresponding lib dirs.

Ah, that means you have VS 9.0 installed, not Win32 SDK, right?

Well, I do not have VS 9.0.

Maybe you could try to fix the autodetection code?

It is not really complicated, it resides in ide/AutoSetup.cpp.

Well, you have old SDK. Current version is 6.1a.

d:\upp\uppsrc\CtrlLib\CtrlLib.t(200) : error C2001: newline in constant

This is a known but stupid problem.

Quick fix is to switch your Windows to English locale.

The problem is that MSC compiler tries to interpret strings as if they had multibyte encoding. It is
most likely MSC bug.

We have

```
#pragma setlocale("C")
```

which should tell compiler not to do such thing, but it seems to be ignored...

Anyway, maybe you could try to put the pragma directly into .t file or maybe into Core/t.h.

(I do not have chinese XP here to test).

[View Forum Message](#) <> [Reply to Message](#)

i remember now this occurred on previous versions. and later corrected.

the pragma is already in .t and i tried to add it directly into t.h, but still failed.

I fixed AutoSetup.cpp.

At 221 line have a conditional variable error:

```
if(IsNull(sdk9))
```

That should is:

```
if(IsNull(sdk))
```

recompile Theide, MSC9 automatic setup is correct.

[View Forum Message](#) <> [Reply to Message](#)

That's simple. You don't need reinstall XP to English, just to do:

All thing OK! But some Chinese application might have messy code.

I simply add a space to some multibyte character string end of line.
for example:

```
zhCN("some chinese")
```

Change to

```
zhCN("some chinese ")
```

I know that not a "true" resolver, but it work.

Well, the reality is that 90% of nightly builds is more stable than "stable release"... (more bugs fixed)

You can consider "announced releases" (comes approximately each 14 days) to be the equivalent of "stable release", at least for now.
