If you use a template variable with multiple parameters as a function argument, it makes the code completion stop at the "," inside the <>.

You can try this with the following existing function:

```
void Escape(ArrayMap<String, EscValue>& globals, const char *function,
Callback1<EscEscape&> escape)
```

This will break at "ArrayMap<String," then "EscValue>& global," then "const char *function" and finally "Callback1<EscEscape&> escape".

Tested with svn version 1062.

What do you mean by "stop"?

When you use code completion, and press enter on the function(e.g. Escape), you get a nice tooltip with the function and its arguments. Highlighted is the part that you are to enter.

It looks a bit like this:

```
void Escape(ArrayMap<String, EscValue>& globals, const char *function,
Callback1(<EscEscape&> escape)
```

The bold part is broken wrongly, because it just finds the first ',' char. But since this is part of a template argument, it should be skipped. The function has 3 not 4 arguments.

Thanks, fixed.

Mirek
