Subject: Events to spin buttons, add mousewheel too.

I want to react when users change month or year but currently I can't see where to attach my code.

Another good improvement would be the controls to change with mousewheel too, like FLTK and eve pageUp/PageDown, and keyboard navigation too, actually it can't be focused or participate on the keyboard focus switch.

An example attached using msegui http://msegui.org/

As a quick soluction I did on CalendarCtrl:

```
private:
 typedef Calendar CLASSNAME;

public:
 FlatSpin spin_year;
 FlatSpin spin_month;
 FlatSpin spin_all;
private:

 static const int cols = 7;
 static const int rows = 6;
```
