I want to react when users change month or year but currently I can't see where to attach my code.

Another good improvement would be the controls to change with mousewheel too, like FLTK and eve pageUp/PageDown, and keyboard navigation too, actually it can't be focused or participate on the keyboard focus switch.

An example attached using msegui <http://msegui.org/>

As a quick solution I did on CalendarCtrl:

```
private:
    typedef Calendar CLASSNAME;
```

```
public:
    FlatSpin spin_year;
    FlatSpin spin_month;
    FlatSpin spin_all;
private:
```

```
static const int cols = 7;
static const int rows = 6;
```
