Hello everyone!

I wish to add GoogleTrabslator as web interface API tools!

I want to discus about this:

1. Is need to add this?
2. Who know details about license? Is compatible with BSD licence (which is U++)?

I would like to divide in core GoogleTranslator and GUI that will be a demo of GoogleTrasblator.

Why need to divide this? Because the core GoogleTranslator will can be use in translation files with extension *.t (translation files) or it cat be use for user translations!

I would like to see your opinion about this!

Thanks you in advance!
