I installed autobuild 1236 today. I rarely do that, preferring to keep a slightly forked 2008.1, a heavily forked older SVN and the latest one in different trees and building as necessary.

I noticed some issues with this clean install:

1. Autoseup does not detect Win SDK. The problem is that I'm using a SDK 9 version with the registry path of "Software\\Microsoft\\Microsoft SDKs\\Windows\\v6.0A". This should be added to ide/AutoSetup.cpp:35+.
2. The bottom part of the code navigator bar is not updating. Using Ctrl-click to jump around items sometimes populates the list, but it is unreliable.
3. I can't get BLITZ to work. I think I noticed this a while ago. Binaries are even put in out/MSVC9.Debug.Debug_full.Gui.Noblitz or out/MINGW.Debug.Debug_full.Gui.Noblitz folder.

A bug (not related to auto-release), now fixed...

Number 2 seems to be caused by the symbol tables from Assist++ being messed up. Topic++ "Insert Symbol" doesn't show any class members either.

from Assist++ being messed up. Topic++ "Insert Symbol" doesn't show any class members either.

Hopefully fixed as well. Please check.

Fix seems good. Thank you.

Well, I do not have this particular SDK installed now. Do you think you could propose the workable patch to AutoSetup.cpp?

```
String sdk9 = NormalizePathNN(GetWinRegString("InstallationFolder",
                                             "Software\\Microsoft\\Microsoft SDKs\\Windows\\v6.1",
                                             HKEY_CURRENT_USER));

if (IsNull(sdk9))
    sdk9 = NormalizePathNN(GetWinRegString("InstallationFolder",
                                             "Software\\Microsoft\\Microsoft SDKs\\Windows\\v6.0A",
                                             HKEY_CURRENT_USER));
```

works on my system. SDK 6.0A seems to be related to VS9 rather than VS8.
