I think Thelde could benefit from better icons! Why can be count the pixels on almost all Thelde icons? can't we get someone to create nice anti-aliased ones?

U++ has come a long way the past years in terms of technical improvements, but Thelde still look like it's from 1996 ?

I just noticed one icon that looks better: the SVN sync icon!  
It's a start, but I think we should re-vamp Thelde completely!

Thoughts ?

Jan Wilmans

Agreed.

BTW, svn sync icon is better because it is already designed with new (well, "new", it already exists for some years) icongenerator, which has "antialiased mode".

I think we could replace some (or all??) icons right away using

<http://www.famfamfam.com/lab/icons/silk/>

they are 16x16 icons (i think) but at least they could give Thelde a completely new look without much design time.

I also think, if we create an list of icons and specify what we want an icon to represent, we could let robert create even better icons for us! We do need to specify 'what' exactly we want to 'express' with the icons we need

Greetings,

Jan

Good tip.

Now, the question is whether we should replace icons in CtrlLib with these, or rather create a new 'art' package.

I vote for second option. Besides, it will make possible to somebody else to do it (any volunteers?)

That's funny, I have been collecting an "art" package for an application of mine. I even started making one with a bunch of standard Vista icons, sized 48x48 (one can always smooth rescale them anyway), for example. In a day or two, I can always add more to the community art package.

I send as attachment, the .iml file I've been using with standard Vista icons, including overlays. I have quite a few more to work on, and when I have all I can gather, I'll zip the package directory. Depending on availability, we could merge together all sorts of "standard" icon collections, (Windows Vista, Gnome, KDE, OSX, etc.).

EDIT: Emphasis on "collecting". I've been making these packages from existing images.

EDIT: File taken out to avoid copyright issues.

Just to add more icon images to the mix.

Here's a zipped package ("Alternative Art") consisting only of two .iml files: the one from the post above, with 48x48 images (WinVistalImages.iml), and another one consisting of modern 16x16 button images (WinVistaBarIcons.iml).

Regards,  
Francisco

Hello,

I got these originally in .png format, from a .NET coding friend who got them from the Visual Studio image library.

The ReadMe file states:

Use Restrictions: These common elements are to be used in the development and illustration of new custom imagery. As part of a visual language, these images (or any part of the images) must be used in a manner consistent with the name of the file, which is self-descriptive of the action, or verb, that the imagery represents.

There is no license notice included in the zip, so it seems that the only use restriction is that these images should be used consistently.

EDIT: Found the license terms somewhere online. The Image Library is considered "Distributable Code", which is open to copying, distributing and modifying, with a few restrictions.

Distributable Code: The software contains code that you are permitted to distribute in programs you develop if you comply with the terms below.

...  
Image Library. You may copy and distribute images and animations in the Image Library as described in the software documentation. You may also modify that content. If you modify the content, it must be for use that is consistent with the permitted use of the unmodified content.

...  
Distribution Restrictions. You may not

come from or  
are endorsed by Microsoft;

run-time  
technologies or application platforms;

subject to an  
Excluded License. An Excluded License is one that requires, as a condition of use, modification or distribution, that

EDIT: I see the confusion caused by my wording. While I've been making (in the way of compiling together) this U++ package, I'm not the author of these icons. I edited my post above to clarify this.

Mirek, an Art package (although I don't know what it means, in term of development effort) look like a good step, does that mean anyone will be able to create new 'themes' for Thelde that include all icons ?

That would be great, in my opinion.

Yes, apparently they can't be used after all. It is a shame.

I'm removing them from my app now, and making new icons from scratch by myself.

They're certainly not as good as the other ones, but I think they're functional. You can check them in the attached new\_upp.iml file. These ones have no obscure license attached, guaranteed.

Hello ptDev

They look good and are much richer than the default icons.

I would use them and I wait for your new releases.

If they can be in some kind of "Art" package with different sets of icons and art it would be great.

Best regards  
Koldo

Hello to all,

I am now sending you a zip with an icon art package, which I hope will be found useful in Ultimate++ applications in general. It includes those images I made during the weekend, plus quite a few new ones.

Quote:

The art is contained in a Ultimate++ package, in theIDE image editor format - the same tool used to draw them. This package is a permanent work in progress, and as such, new icons will be added from time to time. Also included in this package is a file with icon elements (elements.iml) that may be combined to make additional icons.

Once built, the package allows you to import BarArt images in three different sizes, each corresponding to a different image class: BarArt16, BarArt32 and BarArt48. You may, however, prefer to import individual icons to your own packages as needed.

For example, should you want to use the 32x32 Calculator icon, just enter BarArt32::Calculator() where the API expects a reference to an Image.

To use, add the BarArt package to your own, and #include <BarArt/BarArt.h>

The available methods, common to all supplied BarArt image classes are listed below, and their names are self-explanatory:

New()

Open()

Save()

Undo()

Redo()

Cut()

Copy()

...

Settings()

If anyone tries to compile theIDE with some of these new icons, it might be interesting to post a screenshot, so that we can see how it would look with them. Have fun.

Regards,  
Francisco

I've tried replacing some of the icons

screenshot:

Personally, I think it shows the potential of Thelde to look good is there. I'm not happy about all icons being tilted to the right, what is with that?

Mirek: could we use 48x48 icons and make the height on the toolbar adjustable? (so the icons and scaled up or down accordingly?)

Too make the comparison fair, i've replaced the icons in thelde with 16x16 BarArt icon here.

I think the BarArt icons look good, don't get me wrong, but what is it that the silk icons have that make them look so much better, even though they are 16x16 too ??

(the icons in the greenish border are from  
<http://www.famfamfam.com/lab/icons/silk/> )

Gr,

Jan

Thanks for trying them.

I was having second thoughts about my decision to use tilted icons myself, but your second opinion seals the deal. I'll fix this. It's better to make straight versions for some icons, where being tilted ends up looking bad, and make the tilted version not the default for those. I need to find a compromise in the design somehow. The icons you showed, for example, should be "straight".

Note that you can always copy icon parts from the elements.xml file, paste them together and leave them straight, if you'd like to try some differently.

Thanks for the feedback.

EDIT: Whoa, those Silk ones are really nice! Where did you find them? I'll pack those in another class.

I'm also missing a few essential Thelde icons, like:

- the "C" Source icon
- the "Package" icon
- the "Bomb" icon

the C and Package icon are used a lot,  
so I think it's important they look especially good.

Gr,

Jan

Hi again,

I have fixed my library: my icons are all straight now, the "tilted" ones have been given a 't' prefix. The most important icons have been added (source and header files, compile, 2 versions of rebuild, and a few others). I'm too tired to make the "package" icon now, but I'll upload it tomorrow.

Furthermore, I also added to the package the Silk icon library from the link given on the top posts. To access those icons, use the Silk class. The methods have the same name as the original .png files, except for new.png and delete.png, for obvious reasons: those have been named new\_() and delete\_().

It should now be easy to test both sets of icons, but anybody planning to use the Silk set should contact their author.

Quote:

```
#include <BarArt/BarArt.h> // BarArt48, BarArt32, BarArt16 sets
#include <BarArt/Silk.h> // Silk set
```

Regards,  
Francisco

Concluded version 1.0 of BarArt, the following fixes were implemented:

- Improved contrast in some 16x16 icons.
- Added images for theIDE: a few package icons and an internationalization icon.
- Reproduced theIDE application icon (included as a 128x128 image in BarArt48 class): tried to keep the classic look, but make it a bit shinier.
- Added Building\_1() and Building\_2() icons as an animation for theIDE app icon while it's building.
- Added contact information for the author of the Silk icon package
- Added separate icon list file for all classes in the package.

Known issues:

- Designer icons still missing.
- Some images in Silk class are rendered with a white background, this is caused by inconsistent alpha channels. There are over 1000 (!) icons in this class, so it's better to fix this only as needed, rather than comb every single image. Although it's easy to open the icons in the Image Editor and fix them, please PM me and let me know which need correcting, so that I can include the Silk fixes alongside the BarArt ones.

You can see a preview running under Vista here:

Now that I'm thinking about it, I should add the possibility to my theme loader to load a set of images. The only question is how to identify these images. Should we have some fixed string names for images, like "file\_open"?

BTW, I like Silk.

BTW, I like Silk.

Silk seems to be very popular indeed. We all like it.

(I just fear my hard work making new icons was for naught )

wxWidgets has a pluggable artwork framework called "ArtProvider", where they define a number of standard icon names and allow alternate artwork to be pushed preserving consistency (they do use ugly ALLCAPS\_CONSTANTS for everything, though). Perhaps a similar solution could be implemented for this.

Well yours a fine too, but much too blurry. If you could reduce the blurriness factor they would look much better IMO. I know that this is 2009, but not everything needs to be antialiased .

I'll try to compile a list of icons and post it in the themeing thread for review after I finish my zip support.

Another screenshot.

I agree that some icons need to be less blurry, anti-aliasing is one thing, but it shouldn't make the meaning of the icons hard to make out

Also there are quite a few icons in theide (>50) I think, not all of them are immediately apparent (like the FastSource/FastPackage)

I think BarArt is a good start. Now that we have at least a partial alternative set of icons we should device a way to make them dynamically loadable at runtime, I'm thinking of 'theme-art directories' that contain a index file to match internal icon names to actual icons.

Glad for the constructive feedback, and especially glad that the alternative TheIDE icon ended up looking good.

I'm going to rework (probably, again from start) a bunch of icons to make them sharp enough to be clear - cut/copy/paste and file icons are very important, so I'll give those extra attention.

While a standard artwork mapping method is defined, I'll make a new version of BarArt, and if you come accross any Silk icons with a faded white background, send me their names, so that I can clear the background. That icon set is very complete, and we could reskin TheIDE much faster by adopting it.

Well, everyone seems to agree we should make this configurable, I would like to add/propose: configurable at runtime, so an executable should be able to contain multiple sets/skins/themes whatever we decide to call it.

The question now is, who is going to be implementing it  
I'm very inexperienced with the U++ libs myself, but as I have said before, I would like to learn...

As for the issue of icon names... In fact, everything needed is already there.

Any image in .iml has its name and is addressable by the name and iml class name (like CtrlImg).

At the same time, it is possible to overwrite any icon.

see

```
int GetImlCount();
String GetImlName(int i);
Iml& GetIml(int i);
int FindIml(const char *name);
Image GetImlImage(const char *name);
void SetImlImage(const char *name, const Image& m);
```

If you can provide "alternate .iml", just make names the same and we can then simply write 10 lines of code to "patch" existing iml class with anything else.
