
Subject: Question about Blitz (bug?)

My existing projects often do not build using Blitz.
When Blitz is turned of there is no problem.

The problem lies in (re-)defining macros in different files.

suppose: foo.cpp has:

```
#define FOOBAR foo
```

and bar.cpp has:

```
#define FOOBAR bar
```

normally these definitions stay within the scope of the file, but with blitz on, they seem to clash?

I this normal behaviour for blitz? and should I just disable the use of blitz for these files? or is it a bug ?

Greetings,

Jan

Actually, BLITZ should undefine them when needed. But perhaps something does not work as expected.

You can check what BLITZ does looking at \$blitz.cpp file in output directory.

Alternatively, you can submit a testcase that demonstrates the problem.

To report on our private discussion about this;

The behaviour is a feature, .cpp files that redefine macros that are elsewhere defined in header (.h) files are undefined by blitz.

This behaviour is (apparently) required to make blitz work; to compile sources that have this problem, there are basically two options:

- move the defines into header files and include them in the .cpp
- disable blitz for the effected files

Greetings,

Jan
