Hi all. I know it's not very polite to introduce myself with bug report, but...

I would expect following code snippet to return true for "link" (tested on Linux Mint 7.0; based on Ubuntu Jaunty):

```
#include <Core/Core.h>
```

```
using namespace Upp;
```

```
CONSOLE_APP_MAIN
```

```
{
```

```
String parentDir = GetFileDialogue(GetExeFilePath()), targetDir = AppendFileName(parentDir,  
"dir");
```

```
//RealizeDirectory(targetDir);
```

```
/Sys(Format("ln -s %s link", targetDir));
```

```
Sys(Format("ln -s %s link_to_dir", GetExeFilePath()));
```

```
FindFile ff(ApellidoFileName(parentDir, "*"));
```

```
while (ff.Next()) {
```

```
Cout().PutLine(Format("%s: %s", ff.GetName(), ff.IsSymLink() ? "true" : "false"));
```

```
}
```

```
Cout().PutLine(Sys("ls -la " + parentDir));
```

```
DeleteFile(ApellidoFileName(parentDir, "link"));
```

```
DirectoryDelete(targetDir);
```

```
}
```

According to <http://manpages.ubuntu.com/manpages/jaunty/en/man2/stat.2.html> problem is in stat() call being used instead of lstat()

If this behaviour was actually intended, I suggest adding default parameter to both FindFile constructors:

```
FindFile(bool use_lstat = false);
```

```
FindFile(const char *name, bool use_lstat = false);
```

or perhaps

```
FindFile(const char *name, bool use_lstat = false);
```

```
bool Search(const char *path, bool use_lstat = false);
```

My preference is to use lstat() only. Thanks for great framework, Lubos

Maybe we should use lstat only to detect the link?

Mirek

That's fine with me. Thanks, Lubos
