Both C++ and this framework are foreign environments at this time...

That said, I have added a new layout/tab to the addressbook example. The intention is to ultimately have a full RTF editor at that location but for now I'll settle for DocEdit.   However, I don't know how to get rid of the current ArrayCtrl present in the first two.

I assume the issue is how to initialize,

   WithOutputLayout<ParentCtrl> output;

On a related matter, how does one make the whole dialog resizable?

Finally, are there any examples of this type of simple tabbed application with just code and no visual layout?

Thanks.

Hello ksingh

Quote:On a related matter, how does one make the whole dialog resizable?

Add a Sizeable(); in the window constructor:

AddressBook::AddressBook()
{
 ...
 menu.Set(THISBACK(MainMenu));
 Sizeable();
}

And in the layout editor change the "springs" with "rods" by clicking the "spring" with the left button where it makes sense. I mean:

This way the control width-height will follow window size making it really resizable.

Best regards

Koldo
