Modern things should look modern. This thought led me to idea of polishing TheIDE UI.

Things I want to show is mostly a subject to discussion and critics.

My first attempt is a little beautifying of package files list.
Here it is:

Clicking item switches between .cpp/.h/... files (current file icon is the rightmost and opaque while others are semi-transparent). Small icon to the left is the symbol of recently changed state (from almost invisible gray towards green).

Do you like it better then current list or not? What would you change here?

Nice look!

Hello Mindtraveller

I agree with it and with your proposal

Quote:Modern things should look modern

Perhaps it is a good time to do some face lifting to some controls.

For example I wonder myself why I usually prefer GridCtrl over ArrayCtrl... and certainly it is because it looks better.

I do know that that reasoning is not very scientific but many times if an application looks nicer and more modern it seems to be better, although perhaps it is not.

Best regards
Koldo

I agree. We need to do some skinning.

Regarding ArrayCtrl, the goal was, as with most other widget, to make it look native.

However, there is 'art' directory in uppsrc supposed to host skinning packages. Submit one

Mirek

I thing that we need to integrate and code folding. it is very useful.

I see two things here which is not simple skinning:

- 1) Changing underline with icon indicating last changed time
- 2) Collecting files with equal names into one record. Clicking it switches between these files.

Am I right and does it change a bit the code of TheIDE, or is this simple skinning too? Anyway, if it needs some changing of code we could make "step one" to add theme to Art directory and after that "step tow" - Mirek will change this code when he has time fot that in future (support for collecting files into one record, see (2)).
