Hi,

I found funny problem with TabCtrl. When I maximize and minimize TabDlg example program when the second tab is selected, first tab "disappears" (see attached screenshot).

Steps to trigger this behavior:

1. Add MinimizeBox and MaximizeBox to TabDlg example program.

GUI\_APP\_MAIN

```
{
    TabDlg dlg;
    dlg.MinimizeBox().MaximizeBox();
    WithTab1Layout<ParentCtrl> tab1;
    WithTab2Layout<ParentCtrl> tab2;
    dlg(tab1, "Tab1")(tab2, "Tab2")
        .OKCancel()
        .Title("Tab dialog");
    dlg.Run();
}
```

2. Run it, switch to the second tab.

3. Maximize window

4. Minimize it to task bar.

5. Restore window (first tab should be gone).

Easy fix is to edit CtrlLib/TabCtrl.cpp, TabCtrl::Layout and add a 'SyncTabs();' statement before the final line in that method, the one with 'Refresh();', while possibly commenting out the original call to SyncTabs in the same method.

Sorry for poor solution, this is just at 30 second glance over the source code; I don't have time right now to investigate why this is happening. You also don't need to maximize the dialog for the bug to appear; it is triggered by minimizing and the reduction of the control in size so much that it tries to bring out of view other tabs.

It seems that your "poor" solution did the trick . thanks.
