hi there

i am struggling with the iml stuff. got a sample down attached.

a project, which is barely a template CtrlLib project with main window and an iml file includes another project, which is also a bare Template CtrlLib project, with another iml file, they are kept separately, i dont mix them, nether include header of the included project, simply include the project in package organizer.

compiled with MINGW DEBUG, with the release shipped in upp 2008.1 and all shared, release version 1659

starting the application under VISTA goes well, but it crashes ugly when closing it. using a smaller (or the original includen iml from template, with a dummy image inside) goes well. this occures only under vista, NOT under XP pro or home.

NO IDEA about that. guess its due to some kind of memory alignment, allocation or related problems when using the iml. maybe the iml is too huge...

for security reasons i included the exe also in the zip, soto verify. --> had to go, file size limit 2097152 bytes

is there anything i have forgotten???

greetz

PS: using the zip: simply extrect into MyAppz and use CtrlLibTest, which uses the CtrlTest2. compile MINGW DEBUG all shared and run under vista (home premium)

No problem with XP and MSC

hi mirek

yes not problem with msc at all, neither under vista..

i found out with testing that, using simple 32 images, 1 px wide enad height, no problem, but as soon as there is 33 such pics, (or actually any kind of, but more than 32 pics) it crashes.

but as i said, MINGW DEBUG (release also i think) under VISTA.

is there some kind of restriction in the iml parsing stuff (i found in the iml_source some hints of 32 beeing kind of a limit of a IMAGE_DATA...

as a workaround, one could use multiple iml, with not more than 32 pics, but it should be made clear to the publics

PS: a test iml file with 32 1px pics attached

Nonsense. See .imls in CtrlLib. Must be something else.

My bet is some issue related to destruction of .imls. Have you tried to debug it and spot the crash place?

was only a guess

i used profiler from dependency walker to analyse the start and quit of the CtrlLibTest.exe

here comes the result it's doooooown down after detach of mingw10.dll, seems to be in the NT stuff somewhere.

for me unfindable. i'm not an expert in that sense.

thanks mirek

i think this problem is also related to what is found in
<http://www.ultimatepp.org/forum/index.php?t=msg&goto=22800&>
and
http://www.ultimatepp.org/forum/index.php?t=msg&goto=23352&#msg_23352

so using another gcc version like the current TDM one might solve the problem, i'll try to investigate

Hello kohait00

If you want you can send your updated sources and I can try them with MinGW TDM.

Best regards
Koldo

hi koldo, thanks for help.

actually there's no code change needed. simply follow my first post. the Test project should be *compiled* under WinXP (dont know if it makes difference if home or pro) and *run* under Win Vista. on quit it should crash. if you compile and run Vista, there seems to be no problem with it. its strange.

so i think the error is really related to memory stuff, maybe even with UPP HEAP, have not tried USEMALLOC. i will try that though..

well i took a look in the code in the Defs.h,
USEMALLOC is defined for MINGW anyway, so UPP HEAP isn't used there anyway.

but it still can be the problem with the mingw bugs mentioned.
curious how your test will terminate..

CORRECTION: it even crashes compiling MINGW dbeug on vista itself. there using the release 2008.1/mingw

Ok, thanks to koldo, who provided me a TDM MINGW compiled version of the CtrlTest.exe, the error DID NOT occur anymore. so it seems to really be related to the buggy MINGW.

koldo, please post a downloadlink to your used MINGW environment or is it the current TDM 4.4.1 second release?

thank you very much for assistance.

==> seems the Upp release needs a new MINGW package to ship with.. would make sense, right?

i tried it now myself, downloading the TDM current release from

<http://www.tdragon.net/recentgcc/>

or direct link

<http://sourceforge.net/projects/tdm-gcc/files/TDM-MinGW%20Installer/1.908.0/tdm-mingw-1.908.0-4.4.1-2.exe/download>

and it works fine without crash
thanks, i'll be using TDM gcc now

Hello Mirek

As usually MinGW TDM is the most complete MinGW version and in our case the only one that permits MT, perhaps it would be good to indicate it in the web page and documentation.

Best regards
Koldo
