Yep have to agree! UPP is a really great project.

I am familiar with OSS development tools. Just spent the best part of a month reviewing again for a project. It's not a very big project, but there are specific issues - deployment, database support, printing support, graphing and of courses the GUI.

It surprised me how many trade-offs have to be made to use Open Source development tools. There a problems with UI design, and 'basic' utilities such as printing. Deployment is a real pain in the ass for most of the tools. Have looked at Python , Tcl-Tk, Ruby, Rebol. Non was able to meet my needs. Cannot afford either cost or overhead of MS tools and likewise the overhead of the VM in Java is a problem.

Would be good to have cross-platform for Mac OSX.

May be able to help with numrical / statistical library after this project is over in the New Year. Don't know if this is of use to anybody. Also, may put together tutorials on designing project from scratch as I think this is badly needed in all OSS dev tools projects.

Anyway, great project, great widgets...not sure I'd worry too much about native stuff...and nice editor. BTW think creating Rich Edit and PDF support from beginning was really good idea. It's surprising how many tools leave this stuff out, but it's widely used!
