Subject: Problem linking theide
Posted by dolik.rce on Sat, 30 Jan 2010 00:52:01 GMT

Hello all,
I've encountered some errors when building theide using generated Makefile. It fails during linking,
complaining about undefined references. I'm probably just being stupid and overlooking
something I'll be glad for any hint about what is wrong. For details, please see the attached file,
which contains the relevant part of makes output.

Best regards,
Honza

Oh, and a few details I forgot to mention yesterday (late night post) :
In theide it builds just fine. So it might be something in the Makefile. I tried with releases 1967 and
1984. Theide used to generate the Makefile was 1967. I attach the Makefile, it has custom install
target, but I never touched the building part.

Thanks for any help,
Honza
