Subject: Workaround: Hybridizing SqlExp usage
Posted by alendar on Sat, 06 Mar 2010 20:52:35 GMT

I found that SqlExp is flexible enough to let me use it halfway, which really helps.

I needed to reference a different schema in my MySql database, but as far as I know there is no way to prefix my table name identifiers with the schema. I often have to reference multiple schemas in a single query, so I'm glad I found a way.

Here's what I did:

```
if (!(lst *
 Select(SqlCountRows())
 .From(SqlId("information_schema.tables"))
 .Where(SqlId("table_name") == localUserTableName)))
{
```
