Hello,

I am trying to replicate an application written in PHP+MySql with Upp+Sqlite. I have two questions.

1) With the following table I have problem at runtime

```
TABLE_(DBELO)
  STRING_ (NOME, 35)
  INT_ (ELO)
  STRING_ (CAT, 4)
  INT_ (K)
  STRING_ (SIGLAPROV, 2)
  DATE_ (DATA)
  INT_ (IDFIDE)
  INT_ (IDFSI) PRIMARY_KEY
  STRING_ (SEX, 1)
END_TABLE
```

ERROR Cannot add a PRIMARY KEY column(0): Preparing: alter table DBELO add IDFSI integer primary key

The problem disappears if I move the field

```
INT_ (IDFSI) PRIMARY_KEY
```

at the top of declaration. Is it normal?

2) I have used the Firefox plugin SQLite Manager to import the data (csv file) from MySql into Sqlite database. Now I am going to write the Upp code to perform some operation. The question is: Do I need a schema file in order to work with a sqlite database? Can I update, select, delete data without a \*.sch file?

I know that it can simplify the tasks but I do not care.

Thank you,  
Luigi

The problem disappear if I move the field

```
  INT_    (IDFSI) PRIMARY_KEY
```

at the top of declaration. Is it normal?

I am afraid yes. Why do not you want it to be first?

No, you do not.

Yes. You might need to define some SqlIds if you want to use SqlExp. And you cannot use S\_\* structures to fetch whole records.

But other than that, of course, you do not need .sch. .sch is just extension/option.

Hello,

because using sqlitebrowser I can import without problem a cvs file exported by MySql with phpmyadmin. If I mix the column order a mismatch occurs and I need to prepare my own import routine.

Hm, I would just remove PRIMARY\_KEY... and perhaps replace it with INDEX.

Mirek
