I've noticed that if DropList has any SubButtons and it's parent control is disabled, it's buttons still look enabled. I tried adding these lines to public section of DropList, but it didn't help:

```
void      Enable (bool enable = true)      {for(int i=0;i<GetButtonCount();++i)
GetButton(i).Enable(enable); Ctrl::Enable(enable);}
void      Disable()                        {Enable(false);}
```

Maybe refresh method of Ctrl work?

If you want to re-enable drop list the the state of ctrls need to change to initial state!

tojocky wrote on Fri, 19 March 2010 23:22 Maybe refresh method of Ctrl work? No, it doesn't.

tojocky wrote on Fri, 19 March 2010 23:22 If you want to re-enable drop list the the state of ctrls need to change to initial state! Actually I want to disable additional SubButtons when I disable DropList.

I hope someone who knows how Ctrl is drawn when it's parent is disabled will tell how to disable DropList SubButtons.

Patch. Change this:

```
if(!IsEnabled() || i >= 0 && !button[i].enabled)
    return CTRL_DISABLED;
```

To this:

```
if(!IsShowEnabled() || i >= 0 && !button[i].enabled)
    return CTRL_DISABLED;
```

CtrlLib/MultiButton.cpp line 258.

Thank you very much! Just checked and it works perfectly.

Hope this patch will be on SVN.
