
Subject: sqlite busy/lock timeout patch

I had a lot of problems with sqlite in a multi threaded and multi process environment.

It is possible to set a busy handler on a db handle using sqlite3 API, but it is able to handle SQLITE_BUSY only. The problem is, that sometimes I got SQLITE_LOCKED, but in this case, I had to reset the statement be able to successfully retry.

So I modified U++ sqlite classes, to handle a timeout.

You can set negative value as timeout if you need infinite wait. Infinite is dangerous for more than one thread, as you can get infinite deadlock that way.

I don't know if this workaround fits into U++, but I attached the patch.

It is OK with.

Can you please post it as plain files? I do not have tools to apply this .patch format automatically.

Mirek

Yes, I uploaded them.

Btw, you can place this patch into plugin/sqlite3 directory and use Tortoise SVN's Apply Patch menu.

I know, but I do not want to install Tortoise - afraid of getting out of sync with SilkSVN...

Hi,

This patch causes compile problems under linux because of `::GetTickCount()` and `::Sleep()`

the ':' needs to be removed to compile under linux and fallback to the portable Upp functions:

```
Upp::GetTickCount()  
Upp::Sleep()
```

Fixed, hopefully, by removing ":".
