Hello all

We have added a new footer in web. It includes last edit author and page and links to page translations (if available).

From now it is not necessary to add links to other translations in T++ pages (like [en][ru]).

We hope you will like it

Hi Koldo! We said that the menu [en] [ru][...] will be on the left, just below the menu. I began to overlap on top of the page with only one goal to switch [en] [ru][...] would have been visible immediately after the page loads.

Hello Sergey

It is true but finally the approved option has been the one implemented. Because of it [en][ru] links would have to be removed.

It is interesting, but I have not seen the discussion at the forum. Maybe I missed this discussion. Give me a link please.

Hello, Koldo!

I like new feature. Usually I'm doing some mistakes in links of the header/footer of the article, so I'm glad to see that it is not necessary anymore.

Best regards!
Anton

Hi Koldo! We need to constantly switch the language. The fact is that if the menu is displayed on the Russian, but when you click on the forum - everything begins to appear on the menu in English.

We must come up with some solution. Switches the language [en] [ru], which were visible, partially solved this problem.

Perhaps there is no need to add additional buttons visible [en] [ru], just as something to do that when you click on the English-speaking button, the language would not have switched and would have remained the same.

One more time! Article <http://www.ultimatepp.org/index.html> is translated into Russian. Now it turns out that does not reach it and the main keywords that there is a Russian search engine also thrown in a week.

So, come to this page can only if you know the direct address
[http://www.ultimatepp.org/www\\$suppweb\\$index\\$ru-ru.html](http://www.ultimatepp.org/www$suppweb$index$ru-ru.html)

Help!

Hello Sergey

Web translation was done considering that if you were browsing in a language and you go to a page not translated, the English version would appear.

The bad thing of this approach is that when you go are in an untranslated English page, as it is not in another language, you do not have the chance to go the original language.

An option I was thinking about was to change the behavior. If a page in another language does not exist, upweb would clone the English version adding a thin footer indicating that the page is not translated and inviting to translate it.

This would have exceptions like Forum. These would be managed directly by the code that would not add a header.

That's the problem that in the pure html to solve this problem very difficult.

And we are trying to use the 15-year-old solutions.

I see in the task, just everywhere poke switches language.

Although there are tools such as Cookies, PHP Sessions, HTTP POST and GET variables.

By the way, can the visitor rights at the entrance to the site, what language he prefers. And then during the transition to each page to add a URL something like "?Lang=es".

The only difficulty which this is, we should use PHP or CGI (or something like that).

I do not understand why we refuse to anything but pure html, perhaps it is some demonstration purposes. In my opinion, this type of problem, can not be solved in this basis.

Perhaps this decision was taken because of the documentation that lives inside the program. But it is also possible to easily generate semantic paste from tpp files, and all the mechanics of the

site would be dynamic. A variety of modern CMS (content management system) to easily cope with this task (such as Xoops, Drupal or Joomla).

We can not even take a full CMS, but to make the generation of templates.

For example, I have a site I did as follows: (with your permission, I will mention here two references) The first page is pure html -

http://www.svsoft.ru/uslugi_hosting.html,

and the second from the first page makes the page of the site --

http://www.svsoft.ru/main_uslugi_hosting.html.

In fact, there is an internal script (rather simple) `main_.php`, who does all the work. I propose to put the same script on the site www.ultimatepp.org. In addition, this script is able to comb the URL and excludes from it all wrong characters.

Hi guys!

There is a clean solution to this, using pure html. If we use subdirectories for each language, like [www.ultimatepp.org/ru-ru/some\\$topic.html](http://www.ultimatepp.org/ru-ru/some$topic.html). Then each relative link in the page would link to page in given language. For pages that do not exist yet, `mod_rewrite` can be used to serve user the English version, without loosing the language in address. Similarly, exception could be given for forum and perhaps also for addresses without specified language. I didn't have time to test this solution, but it should work...

Another option, without playing with apache modules, would be similar to what Koldo proposed, just copying the english version with special footer to the other language directory for untranslated files. The forum can probably reside on several addresses, like ultimatepp.org/ru-ru/forum/, using simlinks on server (or rewrites). The only problem then would be with links, but that is minor...

OTOH, I don't say that we should stick to static pages. I'm just listing our options. If the dynamic stuff is written correctly, it can be just as fast and gives much more possibilities...

Regards,
Honza

I have already suggested such an approach (doubling in every language and rewrite engine), but he did not fit so that cause additional consumption of disk space.

By the way how to deal with the moment when a man goes into a forum, and then returned. Which language he would have to do this?

Hello all

There have been included some changes in web, adding a header in untranslated pages linked directly and in some cases indirectly to left menu.

It says in the untranslated language header: "This page has not been translated yet. Do you want to translate it?"

There is also in the footer a link to "Do you want to contribute?" inviting to add new contents to web.

Not all web pages at all have been translated. Only the first and in some times second layer of pages linked to left menu.

Forum page is the only one that remains only in English.

Great!!! But, what to do with switch to Forum? Maybe we should do Cookies? This operation is done with Cookies entirely without problems.

It is necessary during the generation, insert a small piece of PHP. And in the htaccess file need to register to html to be processed as php.

I think even that can constrain such insertion only into the template of FUD-Forum.

If you have prepared templates for the site for FUD Forum, I can dig on this issue. (Need templates for ultimate FUD Forum without sql database).

Maybe everybody will like mechanism and we can even extend the functionality of the site and simplify the process of generation.
