Hello!

Please, help. Application (with GridCtrl) crashes when I try to remove rows while executing WhenChangeRow-callback (hitems - out of range, I think).

I need to change the content of tables after changing the concrete cell.

Sorry for my English,
Best regards!
Anton

This is one of those cases I have never been thinking of
Please put a test case here if that's not a problem so I could easily see your intentions and find a cure. Generally you shouldn't insert or delete rows in insert/delete/change callbacks as they are called inside grid's insert/delete/change flow and in such a case only bad things can happen
