I guess this is a valid request:

<http://www.ultimatepp.org/forum/index.php?t=msg&th=2967& amp; start=0&>

Well, anybody willing to add animated GIF support to plugin/GIF?

Mirek

Well, anybody willing to add animated GIF support to plugin/GIF?

Mirek
Hello Mirek

This is very easy. The code is there.

Just tell how you want the interface for:

- loading images: How to cross through StreamRaster-Raster-GIFRaster
- showing them.

Mirek

Hello Mirek

This is very easy. The code is there.

Just tell how you want the interface for:

- loading images: How to cross through StreamRaster-Raster-GIFRaster
- showing them.

Actually, interfaces are already there for Raster:

```
class Raster {  
....  
public:  
    virtual void    SeekPage(int page);  
    virtual int     GetActivePage() const;  
    virtual int     GetPageCount();
```

RasterEncoder might need one or two new virtual methods.

Mirek

Mirek
Hello Mirek

I imagine you say the frame rate (time between frames per every frame) or the aspect ratio .

Meanwhile please think about visualization interface.

[View Forum Message](#) <> [Reply to Message](#)

Hello Mirek

Here I enclose you the files changed.

Just for testing (do not consider it a serious player) I have used the next simple code. It shows 100 frames repeating them if the gif have less frames. Delay is considered but aspect is not.

```
FileIn in(fileName);  
One<StreamRaster> raster = StreamRaster::OpenAny(in);  
int ind = 0;  
for (int i = 0; i < 100; ++i) {  
    raster->SeekPage(ind);  
    image = raster->GetImage();  
  
    Refresh();  
    Ctrl::ProcessEvents();  
  
    int delay = raster->GetPageDelay(ind);  
    if (delay <= 0)  
        Sleep(100);
```

```
else
    Sleep(delay*10);

if (ind < raster->GetPageCount()-1)
    ind++;
else
    ind = 0;
}
```

I have added two new virtual functions:

```
virtual int GetPageAspect(int n);
virtual int GetPageDelay(int n);
```

In GIF format it is defined a delay per frame, but an aspect ratio for all frame set, so a GetAspect(void) version would be valid.

Wonderful, thank you.

But what about Encoder?

Also, maybe you could send me complete testing package so that we can add reference example... (Or you can do it yourself).

Mirek
Hello Mirek

Before doing the encoder I would prefer to prepare the player class . I think it has higher priority.

Anyway do you want to include a Reference example for multipage decoding?. This example (as code updated before) would serve for .GIF and for :TIFF files too.

Quoting Koldo's PM:

Quote:

- Our Gif support does not work well for all samples I have tested from here
(<http://www.animatedgif.net/>).

I have tested bad files with previous U++ GIF support and the problems also appear, so they are not caused by last changes.

Do you know what was the source of our original GIF code to try to get an update or try to now where the problem comes?

Posted by [dolik.rce](#) on Sun, 20 Jun 2010 22:24:02 GMT

Hi,

I just tested the reference player with this image, which is one of the nonworking ones. I came to conclusion that the troubles come from the fact that it is optimized. (Some of the subimages have smaller size).

If I changed the layer sizes in gimp and resaved, it works almost fine, it only changes the disposal method. That could be probably fixed too.

The changed file is attached for reference...

Honza

Hello Tomas

Some days ago I hacked your code to decode animated GIFs.

It works well for some files but there are problems with other.

I checked some of the failed files with old code and the problem appeared.

Honza (dolik.rce) has detected one source of the failure. The Gif he includes has different image size per page (subimage). I think he has got the problem as it happens the same with other failed files:

- the images seems scrambled
- however, the images colors look right
- there is at least one image right

It seems to indicate that the colors are decoded right, but some of the pages begin and end are taken wrong.

I have tried to implement this change in subimage size but results do not improve.

Could you do/fix the code or give me some info about the inner details of GIF format you used to do your code?

Subject: Re: Animated GIF support, anybody?

[View Forum Message](#) <> [Reply to Message](#)

I had a quick look at the GIF format spec. The relevant part is paragraph 20. The data block described there should be loaded in `GifLocallInfo::Load()`. The code seems that it is already doing that.

But since the picture loaded is distorted, it seems that this information (`GifLocallInfo::{x,y,width,height}`) is not treated in `GifProcessor::LoadSubimage()`. It only checks if the values are sane. I guess it should also pad the actual image with transparent frame according to the `x,y,width` and `height`.

Sorry I don't dig into it myself, but my finals are coming tommorow But expect my helping in few days, if it is not finished by then.

Honza

Problem found and solved! Now failed Gifs are opened well

The problem came from animated GIFs have different bitmaps with different sizes and locations, so lets say subimage 3 is the mix of 0, 1, 2 and 3 overlapped in their locations!!

This is an extreme sample of it

Thank you Honza.

Hello Mirek

Included new code for Raster and plugin/Gif.

Virtual funcions added are:

- Rect GetPageRect(int n). Gets the subimage Rect
- int GetPageDisposal(int n). Gets the way the subimage has to be handled by the renderer

Reference/RasterMultiPage example has been uploaded covering these changes.

Very good

Now last disposal method ("Restore to previous") is included in RasterMultiPage Reference demo.

And now is the time for the GIF animation player control. If you tell me the basic class methods I can do it for yourself.

Mirek
Yes

Something somebody puts in the layout designer, enter a file name or String with GIF file, and just plays the animation when the window is opened.

No want to spoil the fun, but I think this is way specialized.... and the moment you add this, people will start requiring support for "real" video (divx, xvid, x264). Are your ready for THAT?

That said, encapsulation of those formats would be really really nice.

But without them, animation player should be reserved for examples or bazaar IMO.

Hello Mirek

I think a GIF animation is not used to display movies, just to show dynamic elements in motion, like an hourglass or a progress bar (remember the foot in Nautilus).

In fact I am working actively in a media player, but believe me, it is really much heavier than a GIF player.

Anyway if GIF animation is not going to be included in CtrlLib I will include it in Bazaar with pleasure .

Hello Mirek

I think a GIF animation is not used to display movies, just to show dynamic elements in motion, like an hourglass or a progress bar (remember the foot in Nautilus).

Well, I have only outlined what IMO people will want after you add any kind of player

Quote:

In fact I am working actively in a media player, but believe me, it is really much heavier than a GIF player.

Still, if current Raster interface is good enough for that, creating Raster player would make possible to connect it with streaming video one day... (represented as Raster).

Quote:

Anyway if GIF animation is not going to be included in CtrlLib I will include it in Bazaar with pleasure .

Well, I can include it with uppsrc, but I do not think it is a generic widget for CtrlLib. After all, RichEdit or Report are separate packages as well.

I have UPP 2467, windows 7 and sdk 7.0

I downloaded the above file "gif.7z" and rebuilt all the "ImageView" sample however:

1. Yes now the gif files display
2. BUT they are NOT animated

by NOT animated I mean that ImageView will display the gif file, but the SAME gif file is animated in the browser (IE, FireFox, etc)

For testing purposes you can use any of the "Smiley Shortcut" gifs

I used icon_redface.gif

Is there a newer version of the plugin available?

Well, the interesting question is what is to be the difference.

I believe MT version should be better if the application performs long processing. But not all apps are MT.

Perhaps the player should be able to do both (or we could have 2 players), and in ST be only able to work with in ST mode, in MT in both modes.

[View Forum Message](#) <> [Reply to Message](#)

Hello

It is done. Now RasterPlayer default is single threaded.

If compiled with GUI MT it is possible to use SetMT(bool) function to set MT or ST.

"Reference/AnimatedClip" demo is uploaded including both modes.

I am really surprised. Both in Linux and Windows, the ST version goes as smooth as the MT version. Perhaps until now I have used MT sometimes it was not necessary. I am reconsidering my point of view about using timers more frequently .

In few days I will upload the doc.

It looks like RasterPlayer package has linking errors:

Linking...

```
$blitz.obj : error LNK2005: "class Upp::Image __cdecl GetRect(class Upp::Image const &,struct Upp::Rect_<int> const &)" (?GetRect@@YA?AVImage@Upp@@@ABV12@ABU?$Rect_@H@2@@@Z) already defined in RasterPlayer.obj with MSC9 compiler, if Functions4U is added to project.
```

This is because GetRect duplicates one from Functions4U.

I've changed function name to GetRectRP and it links fine (quick & dirty).

It would be also great to support gif transparency.

Hello Mindtraveller

Finally I have included a more clean solution.

As .gif raster handles well transparent color, now it is included Alpha() in RasterPlayer drawing, so from now transparent colors are transparent .

Thank you for your feedback.
