Is it possible to right-align text inside a table cell?

failed.

Thanks!

Hi kropniczki,

This should work: `{{1:1:1 [< left aligned]:: [= center aligned]:: [> right aligned]}}`

Little hint: If you want to use some complex QTF, you can try to design it in T++ (or in UWord) and read the .tpp (or .qtf) file in plain text editor to get the idea

Best regards,
Honza

Yes, thank u so much for the prompt answer!

to a printer, like in

```
String qtf;  
qtf = "{{5000:5000 [s0;>%% right-align] :: [s0;%% whatever]}}";  
Report report;  
report << qtf;  
Perform(report);
```

Anyway, it simply does NOT right-align the text. Could it be, dare to say, due to some bug? What am I doing wrong?

Thanks again!

Hi,

I tested it just simply using PromptOK("qtf text..."). If it works on screen and fails on printer, than it is most probably a bug.

I'm afraid I can't help on this one Hopefully someone else will have a look at it...

Honza

[quote title=kropniczki wrote on Fri, 28 May 2010 07:02]

```
qtf = "{{5000:5000 [s0;>%% right-align] :: [s0;%% whatever}}}";
```

The problem is caused by the space you have placed before "::-" - this means that for the last character of paragraph, the right align is not active anymore. And attributes of this character are used to determine the format of whole paragraph.

U must be a genius!!!
Not only you present the solution to the problem, but also explain why, which is amazing!!

Many thanks!

BTW, I've got an handy QTFStr class which encapsulates some of QTF behaviour, in particular for tables.

I made it because is **very** easy on qtf to make mistakes with some spaces or other stuffs, in particular in tables.

The class contains some generic stuffs and a part relative to my app, but that one is easy to strip.

An example of code using QTFStr class :

QTFStr qtf;

```
qtf.StartTable(1, 5, 5, 7, 8).TableTitle("I'm a table");
qtf
    ("")("second col")("third col")("fourth col")("fifth col")
    ("first col").AlignCenter()("center on table remainder", 3)
    .AlignLeft().TableSubTitle("this is bold and spans over all columns")
;
qtf.EndTable();
```

It doesn't support tables in tables, but it's trivial to add (I'll do it when I'll need it).

If somebody is interested on it, I'll be happy to post the code somewhere.

Ciao

Max

Hmmmm ... added
Added also pushing/popping of format parameters for easier usage.

Ciao

Max

Would you mind disclosing those classes?

Tks!

Ops... I've seen the post just now

If you're still interested, here is my code.... beware that it's not cleaned up and it contains many stuffs which are useful just to my app.
But you can easily strip the unneeded parts....

Hello Max,

perhaps your class is what I am looking for to write easily qtf document including a table. Let me ask you if you have some minimalist demo showing some key feature of the class to start with.

Grazie,
Luigi
