I use a very simple graphical Control already in several applications. Once it became necessary to store photos in the database. The following application was necessary to quickly write to the database image of the goods. Thus was born the idea to create a simple control for storing and editing images in the database.

Maybe it's too easy to make it a separate control. But I was so comfortable. Perhaps newcomers this control seem too useful. (I'll be glad if the leaders of UPP include it as standard control in Thelde)

How to use it?

Very simple.

1. Add Package "EditImage" in your project.
2. Add in the beginning "#include <EditImage/EditImage.h>"
3. In the layout designer Add Control "EditImage"

That's all.

To read an image from the database I use code like this.

```
SQL * Select(ANK_PHOTO).From(ANKETA).Where(ANK_ID == dlg.Qptr);
if (SQL.Fetch()) {
    dlg.tabPInf.editimage.FromString(SQL[ANK_PHOTO]);
}
```

To write the image into the database using such a code.

```
SQL *
SqlUpdate(ANKETA)(ANK_PHOTO,SqlBinary(dlg.tabPInf.editimage.ToString())).Where(ANK_ID
== dlg.Qptr);
```

Another nuance! When you record images in this control all scaled to the dimension of 300x300, saving aspect (as in the database must be stored, for example, a standard-size photo).

To change this use `SetStoredDimension(Size sz);`

And in the end. Test application.

Later I'll put this control in the Bazaar.

Hello Sergey,

If this is related to Databases I would put SQL or DB in package name and in name of the control and when someone search for image edit or image in database to don't get the same result. EditImage is a name too generic, IMO DBEditImage will fit better.

Andrei

No, not only database. This, maybe, email,XML, config text..... and so on..

Main idea: EditImage - edit image as string variable.

PS.

But, yes. A little bit generic name.

By the way, anyone knows how to make a crop and rotate photos?
