Subject: Some simple way to convert Image into 1bpp raw data in memory?

I thought it will be easy to do this, but can't figure it out.

Image RGBAimage;
BMPEncoder bmpencoder(1);
bmpencoder.SaveFile("image.bmp", RGBAimage);
FileIn in("image.bmp");
One<StreamRaster> raster = StreamRaster::OpenAny(in);
//... then something like:
const byte * data = raster->GetLine(y).GetRawData();

this does convert RGBA image into 1bpp bmp, load it back from disk and then it's easy to read
raw data trough const byte * data pointer.

Now I'm trying to cut out that unnecessary save/load on disk sequence, and I can't find any simple
way.

So far it looks to me like these are only options:
1) create my own RawEncoder : StreamRasterEncoder which would do the 1bpp conversion in
same way as BMPEncoder does it
2) use RasterFormat to do the conversion line by line (in such case I would like too see what's the
simplest way to initialize it for RGBA (B&W only, no AA) -> 1bpp conversion.
3) use BMPEncoder on some memory stream and read it back from that stream like I'm doing it
now from file?
4) give up and simply do my own conversion code (it's trivial as the source image is B&W only
anyway, it's not true RGBA pic)

any upp guru to tell me which solution is nice and simple to do?

So far I settled down with saving BMP file into string stream, then reading it back from string as
StreamRaster. It not optimal, but the BMP has only around 60kB anyway and it was 5-6 lines of
code.
