Hello, Nick.

When you get data from ArrayCtrl you get it in Value type.
To convert it to integer type you can use ValueTo template:

const Value& v = array.Get(0, 0); // some data from ArrayCtrl
int i;
if (IsNumber(v)) // Check for Number format
  i = ValueTo<int>(v); // conversion
else PromptOK("Error input format");

Also you can use atoi or CParser ReadNumber functions.

Edit:
But if I understood you correctly, you just need to change your DNA5, DNA3, RNA5, RNA3 type
from char to String.

Hello, Sender Ghost!

Please avoid using ValueTo<> function.
For integer values it opens a hell of problems with int/int64 compatibility.
Please consider using i = (int) v; instead.
This is important thing, because with ValueTo<> you may have everything compiled well but meet
a tons of run-time exceptions instead.

Hello

Yes, I think just this is enough:

Value v, w;
int i;
String s;

...

i = v;
s = w;

Thanks, koldo! Your example is shorter and better. I just use explicit conversion for the sake of code readability.

Hello, Pavel.

Thanks, for tip. I read about your experience with such problems on the forum. Practically, it looks like the same (on the 312 line of uppsrc/Core/Value.h), but compiler can do something otherwise.

But, I guess, current problem is different.
char *DNA5 = "A"; or just using A with quotes to Add function is more appropriate.
