Hi,

I hope there are some Arch Linux users out there (apart from myself:)) Starting today, source packages for U++ and theide are available in AUR (Arch User Repository).

The packages are organized in the same way as the ubuntu packages, that is "upp-svn" contains the sources and "theide-svn" or "theide-nogtk-svn" will install theide. As the -svn suffix hints, the packages are based on subversion repository, that means that everytime you update the package it will checkout fresh sources, compile (in case of theide) and install on your system.

If you use yaourt or some other pacman compatible package manager that can access AUR, the command line is something like yaourt -S theide-svn upp-svn. If you don't use yaourt, you can just download the source tarballs on the web, unpack them somewhere and inside each directory launch makepkg, which will build binary package, which can be in turn installed using pacman -U <pkg-ver.pkg.tar.xz>.

I didn't test it on a clean machine, since I don't have any, but everything should work there too. If you encounter any problems, let me know, I'll do what I can to fix it. The only known problem, as on all non-win32 platforms is that the automatic updates don't update the local sources. I am working on the fix for this, please be patient For now, just copying the files over to your local copy should be fine enough:cp /usr/share/upp/* /home/<username>/<upp-directory>/
Also, starting with next stable release, I plan to make stable packages as well.

I hope you will find those packages useful. If the packages are popular enough, they are often moved from AUR to comunity repository, that is by default accessible to every Arch Linux user.

I'm looking forward to your feedback!

Best regards,
Honza

Good job. It is great to be finally in the official repositories of important distros.

Thank you for this initiative! I will certainly use it for the next release.

Chris

Hi friends,

I have the pleasure to announce you that as of today, there are stable (i.e. 2467) packages up, theide and theide-nogtk available in AUR. To install it, follow the instructions above, just drop the -svn suffix. And if you use it, make sure you vote for the package, the votes can push the package into the community repository

Also, I automated the svn version uploads. It runs on my machine, so it works only when it is on, but that is quite often. For now, it checks svn for new version every hour and updates the packages in AUR if necessary. Mirek, would you be interested in moving it on uppbox? Not necessarily with the one hour frequency, nightly would be fine as well.

Best regards,
Honza

By some chance, is there anyone using Archlinux on x86_64? If yes, can you confirm that the PKGBUILD works ok?

Thanks,
Honza

Yes, I meant any of the theide* packages. I realized I never tested it on 64bit system, because I don't have any. Thank you for your help

Honza
