Can anyone plan to bring ultimate++ Widget toolkit to GTK-compatible, GTK# and qt-compatible?
I think we can recompile some apps using ultimate++ instead of sucking GTK+ and GTK#, QT.

I think max. result is upp-gnome and upp-kde

I know this work needs many developers. I can help whenever possible:)

No quite sure what you mean by that.

Do you plan to add U++ interfaces to gtk, ot gtk interfaces to U++?

I think he wants to add GTK API to upp core, so you can take any GTK application and compile it with UPP as backend.

I'm not sure it's possible even for very simple applications, certainly not for complex ones (without patching the code of app to fix major differences).

Still doing some research how much we differ and how much such API wrapper is possible can be interesting. If somebody has enough spare time for almost useless interesting project.

edit:

Rishi: the problem is that GTK vs QT vs UPP do differ a lot even in basics. The principle is similar, but implementation details are vastly different, so any general solution to just recompile simpler GTK app with upp trough some wrapper lib is IMHO next to impossible.

Also what's the benefit of that? The app source will be still GTK polluted, so you get the same app source mounted over undesired backend which may introduce just more bugs then original GTK+.

What has true benefit is to rewrite GTK app from scratch with UPP, that way the power (and shortcomings) of UPP may be demonstrated and both app version will have "native" backend libs, so there will be no additional errors introduced by wrapper layer, so it can be used to directly compare performance of each toolkit (I mean overall performance in terms of SW development, not just speed of code)

OK, I just asked if you can map u++ functions to gtk+ sot that apps can be compiled even without gtk+. I did not say to rewrite or pollute the code using gtk. I asked to 'map' gtk functions to u++. You don't need touse gtk for this :)

I understood you and answered you before, but to make it short:

- 1) no way to map it, the APIs differ too much (unless you write total GTK emulator with upp ... but why? Simply use GTK lib, it's already done and ready to be used.)
 - 2) no benefit, it would be completely useless (again, GTK already exists and can be used, no need to recreate it)
-

Like WXGTK and GTKQT
