Subject: Clang now fully supports U++
Posted by dolik.rce on Thu, 07 Oct 2010 10:51:41 GMT

Hi everyone!

Few days ago new version of LLVM was released. Since the release notes claimed that clang compiler now fully supports C++ standards, I decided to give it a try and see if it is mature enough to digest the complicated internals of U++.

Here is what I found:
There are some minor glitches, but mostly very easy to solve. I will soon post patched files. It will be probably just a few lines. For example it doesn't like something in the __BREAK__ statement (but that is only in debug mode) or missing some constructors for classes used with GLOBAL_VAR macro. I successfully compiled some of the example apps (wc,UWord,...) and also TheIDE. And as we all know, if it compiles TheIDE, it'll compile pretty much anything

I really appreciate the verbosity of this compiler and I think even the compilation times are little shorter then gcc (that is just my feeling, I did not measure it). In my opinion it is definitely worthed to use it and to ensure U++ is compatible.

Best regards,
Honza

Good to make it built-in. Thanks for info.

That's a really good news! I must recompile my clang compilator .Hope to see your patches posted here soon

What patches? dolik.rce has theide open for commits... (At least I hope so..)

What patches? dolik.rce has theide open for commits... (At least I hope so..)

Yes, I have - but this time, theide doesn't require any patch

The changed files are from Core and references. Mostly the changes required for clang are marked with #ifdef __clang__ to not disturb other compilers, but it probably wouldn't hurt anything anyway.

I tested by compiling everything from tutorial, examples, reference plus theide. Clang compiles everything that GCC does. Also I found few bugs in reference apps. Fix for SocketServer and Xmlize_std is included. XmlRpcCall is broken too, but I couldn't fix that.

Best regards,
Honza

EDIT: I got some more time so I changed the file from diff to archive with complete files.

PS: I forgot to mention one important thing: The changed files I posted ensure that clangs works in optimal mode. The debug mode is still on my TODO list...

TODO list...
Looks like I was mistaken/confused. Everything works fine even in debug mode with the changes posted above. Mirek could you check the files and commit them? Then I can put CLANG build method to packaging scripts...

Best regards,
Honza

I suppose all this is only true in Linux ?

clang is not ready for windows if i recall correctly

Hi Sgifan,

I believe that the situation on windows should be quite similar. For some reason I could not found the binaries on llvm.org, but I downloaded it from
http://code.google.com/p/i18n-zh/downloads/detail?name=LLVM-
CLang-2.8-Mingw32-gcc-4.5.tar.xz and it appears to work. I tested it briefly on wine and compiled some simple files. I didn't manage to make it work with U++, but that was probably because I did not try hard enough I think it also requires some header files from mingw or windows SDK, you will have to set up the paths correctly...

Let us know if you make it work and how

Best regards,
Honza

Hi,

Is there any specific reason the changes required to use CLANG instead of GCC have not been brought to the current upp codebase?

I would sure like to see this compiler in the builder selection list.

Best regards,

Tom

Hi Mirek,
Can you support it by uploading those four files from archive few posts above? They are in places where I don't have commit rights. Also checking if the changes are not harmful would be a great help

Tom1: CLANG won't appear in the builder selection list(the one in Build Methods dialog), as it

---

works perfectly fine with the GCC builder. But it can sure appear in your build method list I attach my build method file to make it easier for you, just copy it into the configuration directory of theide (usually ~/.upp/theide/). The settings are mostly standard, so there is high probability that it will work as it is, without any adjustments.

Best regards,
Honza

Yesterday I rebuilt my clang in Win7 64 (one cmakelist.txt must be change manually to get clang compiled in 64b mode). Unfortunately clang still have problems with win api headers (but it's better than it was before) so I was not able to compile and run any upp gui application . I hope they will fix it soon.

Hi Honza,

Thanks for your notes. The CLANG.bm excellently covers what I had in mind -- in addition to the fixes you made to the source previously.

Now I'm having a different problem: Running any application I have compiled with CLANG results in 'Illegal instruction' printed on console followed by immediate end of execution.

Just to make sure the compiler works, I compiled the classic non-upp 'hello world' application directly from shell. That works OK.

Any idea what I'm doing wrong here? (I have a 32-bit Kubuntu 10.10, clang version 2.8, U++ 2791-maverick-i386 from your repository plus the sources have been updated from SVN today.)

Best regards,

Tom

Hi Tom,

That is strange... I use clang 2.8 on 32-bit system too and never hit any runtime error. I'll try on Ubuntu on the weekend if I get some spare time, to see if it is related to the way ubuntu clang is compiled.
