The latest additions to the FileSel component (r2848) have resulted in a problem on Windows (Vista). The file open dialog now looks native (so far no problem), but it has the classic, unthemed, windows look instead of the modern Vista look.  
If I comment out the additions done in this revision to FileSel.cpp, the themed look is restored. Frankly, looking at the code, I have no idea why that is. The call to GestSystemMetrics, perhaps?

Added 2010-11-18: Hmm, weird; on Windows 7 commenting out the added code does not solve the issue. Were there more changes done that affect the file selector than those in FileSel.cpp? To be honest; I liked the non-native Ultimate look better. Is this change of look also a result of r2848 (I do not follow every single revision)?

Aha; got it. So there is FileSel and FileSelector. Aren't we spoiled. So, for the Ultimate look I need FileSel and for an (almost) native look, I need FileSelector.  
Can anyone enlighten me why these two exist? Why not have one and have a flag 'SetNativeLook' or so. The situation now is pretty confusing.

They are two separate dialogs. One uses WinAPI to get the native dialog for your OS. This changes from version to version of Windows. The other is made in U++ and looks the same or very similar on all platforms.

Thanks for the explanation; I guess this makes sense.  
The first remark I pointed out remains though; the native windows version does not follow the theming but looks like if you would set Windows to classic look. You know, the old fashioned square grey buttons.  
I hope the Ultimate looking version is here to stay because I really like it a lot more.

Hello everybody,

I'm very happy to use FileSelect to have native dialog for Windows

```
FileSelect fs;  
fs.ExecuteOpen("test");
```

UPP team is the best

Against, I 'm in need to just choose a directory not a file  
Here is the code i use with FileSel (UPP look)

```
FileSel fs;  
fs.ActiveDir("C:/Test");
```

```
return;
```

```
String selectedFolder = ~fs;
```

In FileSelector (native look), the user must select a file to allow me to have the directory needed.

```
FileSelector fsNative;  
fsNative.ActiveDir("C:/Test");
```

```
return;
```

```
String selectedFolder = fsNative.GetActiveDir();
```

Do someone have an idea,

thank you

```
FileSelect fs;  
fs.ExecuteOpen("test");
```

UPP team is the best

BTW, there is now shortcut:

```
String file = SelectFileOpen("Text file\*.txt");
```
