i actually havent found any example / reference on PopUp functionality, so i did a little code diggin, and put together a helper class.

PopUpC, which is similar to PopUpCtrl (on which there is no docu either). it can be used as base for WithSomethingLayout<PopUpC>, and after CtrlLayout(), it can be PopUp()'ed just in the size one has designed it.

check it out, maybe it can help someone.

Note: You should not have put "GUI" to PopUpC package - that makes it to be listed as main package, which it is not.

yap, saw it late.. thanks.
this will be in bazaar soon, together with some other helpers

I do not know, I considered adding it to 'reference', but I think as demonstration of 'how to do popup' it is way complex... No reason to make two packages for just that...
