Subject: FIX: Value has Value, Value Type VALUE_V

hi,

this works fine

Value v = RichValue<Value>(Value(123));

and generates a Value that has a Value in it..creating a nice chicken egg problem but it does not use VALUE_V as its Type.

please, add
Value.h:275

template<> inline dword ValueTypeNo(const Value*)   { return VALUE_V; }

to have this conceptually right..

VALUE_V is only defined because of Ref.

'generated' value. Or would it harm any other project? Cause valuearray and valuemap have their own id's as well.

ValueTypeNo is only used with Value. Value should never contain VALUE_V.

ok, thats a word..

btw: is there any documentation on 'what is a Ref and how to use it?' i cant quite imagine what it's about

Sorry, no.

Ref is AFAIK only used with Sql::Fetch. But it is a quite strong case to support its existence...

Consider:

```
Date date;
String name;
double price;
sql * Select(NAME, SINCE, PRICE).From(TABLE);
while(sql.Fetch(name, date, price)) {
   .....
}
```
