Quote:char *(*(**foo [][8])())[];
foo is array of array of 8 pointer to pointer to function returning pointer to array of pointer to char
...
We have no idea how this variable is useful, but at least we can describe the type correctly.

Interesting article, cleared thing a bit for me... But I can't imagine someone would voluntarily use variable of type similar to the one quoted above without wrapping it in at least three typedefs

Honza
