Hi All - I've successfully (or at it appears so) installed upp from source on a Centos 5.5 x86_64 platform.

We have a small GIS application (command line image/raster manipulations) that compiles and runs just fine in U++ for Windows. However, when I attempt to build the app on the Linux version I get a bunch of errors surrounding some of the U++ core libraries.

Any ideas on what may be happening below?

Chuck

Hi Chuck,

The errors mostly look like you forgot to add flag GUI. I'm not sure why it worked on windows, though

If that is not the problem, could you tell us what flags and packages does the project use?

Best regards,
Honza

Thanks for the fast reply Honza. That worked.

The packages this program uses are:

Core
Draw
plugin/jpg
plugin/png
plugin/z

On Windows I only needed the MT flag to build this. Any thoughts on why this is?

Thank you for lending a trained eye,

Chuck

Commandline utility. Those packages do not require GUI.
