2 fixes included:

1) "Value v = tabs[cross].key;" does crash when cross is outdated (easy to achieve by clicking with mouse on close inactive tabs without movement and fast enough ... active tab will reset cross to -1, so if last tab is active one, no crash occurs)

2) Close(...) should be IMO called *after* registered callbacks

Been thinking more about the "cross" value, and IMHO in principle it's cached value.

So whenever it may have changed (mouse move, tab add/remove/scroll/resize(rename)/style change), the cache should be invalidated.

And the TabBar::LeftDown should recalculate it whenever it's invalid directly from "p", if I understand it correctly.

Or how about canceling the cache-way completely, is it really so beneficial? Just using the mouse coords every time and traversing trough active areas definitions. (does look to me "cheap" enough to trade the code complexity for it)

Hopefully fixed! Nice one I agree that some optimizations are too aggressive and makes code more complicated. I'll try to simplify this later.

Should I consider this resolved for release?

I mean, we are thinking about doing a release and I do not want any bugs I am aware of in it...

mirek wrote on Wed, 12 January 2011 16:52 Should I consider this resolved for release?

I mean, we are thinking about doing a release and I do not want any bugs I am aware of in it... There is a little one bug related to drag and drop. Dragged tab's image is not correct in one rare situation. This is nothing serious, but I'll try to fix it today or tomorrow.

Also don't forget about the removal of tab before calling callback. Or did I miss something and don't understand how it should work?

From a quick look into source I would say it's wrong on many places, not just the one I proposed in the patch.

edit: the current SVN looks immune to crash (although I have no idea how you did that with that change you committed .. and I'm not going to look, have plenty of own work ... but it looks completely unrelated on first sight).

Yes, I remember about calling Close, I have to think about it. The thing is this code is mostly written by James who based on my QuickTabs and I don't want break something
As for the crash fix - MouseMove was not called which should update cross value, and it was not called because of wrong highlight value. Actually all that happened because of unnecessary optimizations you were talking about (checking if n == highlight).
Thanks again for catching this!

Well, I have another serious issue with TabBar.

I have noticed that changing text editor color in theide/environment sometimes goes awfully wrong.

After a while, I have realized it is caused by

```
void Ide::UpdateFormat(CodeEditor& editor, EditorTabBar& tabs)
{
.....
    tabs.Stacking(tabs_stacking);
```

the reason being that Stacking calls SetData, which in turn calls SetCursor, which invokes WhenAction.

Now, WhenAction is fundamentally reserved for situation when widget detects USER action. It should never be invoked by action of code, such as SetData! (That should do Update to signal modified state; it can invoke some other callback like WhenCursor or WhenSel if needed).

Now, should I sort this out? (I guess given we have SetCursor0, it is just matter of some slight refactoring..)

Mirek

Action issue should be now resolved. WhenAction now invoked only as reaction to MouseDown.

Not sure it is related to TabBar, but I have feeling that TheIDE is now slower when switching files....

Interesting, I didn't have that feeling. But who knows.. If I find some free time I'll try to measure file switch with and without tabbar.

Are there any unresolved TabBar issues you'd like me to look at?

Me: not.

Maybe unodgs?

TabBar.cpp:1930 :

```
if (!CancelClose(v) && !CancelCloseSome(Vector<Value>(vv, 0))) {  
    Close(ix);  
    WhenClose(v);  
    WhenCloseSome(vv);  
}
```

(and line 1973)

Shouldn't the WhenClose callbacks be called BEFORE closing the actual tab? Can somebody more experienced with tabs and callbacks check if it's correct now? Doesn't make sense to me, but I never used it, so maybe I'm just missing something obvious.
