Subject: Has MeeGo better potential than Android for U++?

I think, Intel, Nokia and now looks like AMD too, will be serious about MeeGo.  
some good looking 1.1 release  
and  
screenshots  
made with Qt, I reckon...

They even offer courses for developers, in case one needs.

and because it's not oracle-java problematic (programming and patents meaning) , I think, it's has better potencial for U++ than Android.

And if Nokia had more brain (and haven't been spending billions for Qt ) it could be a serious competitor to iOS, Android and Win7.

I also predict, that triple (even multi) boot small devices (including phones) with touch (hint... ) and voice recognition will start flooding to the market after this summer or so. E.g what is the point to HTC or Nokia make very similar devices for 2 or 3 different OS'es?

Anyway, somehow I believe, that one day, U++ will be used on all of those devices...

After spending some while with Android tablet, the only think I have to say: Well, it would be nice.

I wish they were using Ubuntu instead..

I still shrug at the idea of Java VM used for everything in embedded device. I know pure java with JIT can be quite close to compiled C/C++, but quite close can be IMO notable difference on embedded machines. Even if they already have RAM in hundreds of MBs.

Then there's the sun=>Oracle vs Google issue.

And finally Android is supposedly open, yet if you buy such device, you may have difficult time to simply recompile the ROM and upload your own (depends on manufacturer). And kernel of Android is based upon linux kernel, but last time I read something about it, it was total fork leaving in different direction, so they will have hard to catch up to latest developments in vanilla linux. (although I think there was some talking about to push patches back to upstream and be more in sync?)

So somehow I don't believe into Android. (although never truly tampered with one, so this is just old man babbling )

Anyway, on the paper the MeeGo looks much more promising to me. But let's see first what are the actual devices and actual policy for custom recompiled firmware images and how vanilla they remain over time.

i recently had some meego live image on a stick, it looks really nice. i'd be definitely esier to port upp to meego, and should be considered as well. nevertheless, android has a too huge footprint in market now, that google would take it away because of any sueing issue. they'd rather pay the bills.. so this should not be the reason to place the desicions.

@mirek: how to interpret the statement? nice or less nice your experience with android tablet?

consider, having other things then honeycomb should not be used for tablet, it's the manufacturers' impatience, placing froyo on tablets..so dont be disapointed. more is coming.

2011 is designated as the 'android explosion', following market analysis

apropos:

seems as if NOKIA is going to turn its back to maemo (meego parent) and switch to M\$ win phone 7..the market pressure is noticably too high.. this would change the picture of parket presence of meego again.

Hello all

It seems it is the end for MeeGo. MeeGo chief has been fired. HP and Google are looking for MeeGo engineers. See here.

I still think MeeGo has a potential for U++. The current situation is a PR opportunity. I think it would be useful for u++ if some u++ enthusiasts showed their presence on MeeGo forums. Also, from time to time, I post on our forums what I see not only interesting but what has some incorporated sense for the search engines...

On the topic note, even without a proper Nokia support MeeGo will not die just yet. It's too late and too early. Windows 7 phone is a fire extinguisher for Nokia in this market share losing heat. It might work. If not, MeeGo might be an escape route.

from nokia blog:

Quote:Under the new strategy, MeeGo becomes an open-source, mobile operating system project.

MeeGo will place increased emphasis on longer-term market exploration of next-generation devices, platforms and user experiences.

Nokia still plans to ship a MeeGo-related product later this year.
