I have added two root dirs to svn, with rw acces for anybody.

Use 'patches' to propose patches.

Use 'sandbox' for experiments...

As this might cause some issues with svn logs (because it is going to introduce new log messages), I guess we should tag those with some nice character, like '#' for patches a and '~' for sandbox?

nice thing..

wouldnt it pollute the svn history a bit too much?
again *GIT* is a great option here

BTW: which form of patches do you expect there?
i think for you it's great, kind a pile-up folder for patches that you can review/schedule for apply and delete officially after..

Yes something like that.

BTW, glad you have brought this back:

With Bazaar growing and growing in importance, perhaps it is time to start development new Bazaar packages in Sandbox and only when they achieve "useful" status, move it to Bazaar.
