hi there,

im having this problem, and can't an explanation for it.. any ideas what's wrong? the sizes of the head spacers seem to be misleading..
it changes sometimes when adding new stuff to application..

hello,

i have seen something similar with the TabCtrls in my program. when compiled in debug mode the tab-headers are way too small. if i compile in optimal mode everything is fine though... couldn't find the source of this error till now though...

I have seen this kind of behaviour when choosing auto-springs for widgets on the layout. If I use the left-top springs, nothing bad happens.

well it pretty much looks like there is an issue with some kind of initial values then, or, even worse, memory corruption/overwrites..

Hi kohait

It doesn't look like a problem with springs, there are artifacts which are unrelated to springs (e.g. the height of menu bar)...

Is it reproducible? Did you try to compile on different machine or different options? Did you try full recompile (bomb button)? Could you post the code? (Or even better just a simplified example).

Honza

Hi again,

i dont know, if my problem is the same as kohait's, but...
in tabctrl.cpp at the beginning there is something like:

```
CH_STYLE(TabCtrl, Style, StyleDefault)
{
    font = StdFont();
    tabheight = font.Info().GetHeight() + 8;
```

if i run my program in debug mode, the font.Info().GetHeight() call returns 0. Running in Optimal mode returns 13.

Couldn't reproduce this problem in a simple testcase though, so i think the error is somewhere in my own code...

same with me here, in OPTIMAL using MSC this thing just looks as expected, debug spews the problems..

EDIT: and one more: TDM GCC yields the same thing in debug mode. so it has to be on code side somewhere, depending on debug.

ok, seems i found my error. had a static GridCtrl member in a class like in this thread:
http://www.ultimatepp.org/forum/index.php?t=msg&&th=4820&goto=24145#msg_24145
Replaced it, and everything is ok now.
Perhaps your problem is the same kohait...

Matthias

thanks matthias,

i've posted a comment on this issue in the other thread. there is a simplified testcase which produces same results.

intrestingly enough, it doesnt occure always..depends on static init order..the old problem
thanks for the hint. i'll try to solve it somehow..

I had a similar issue as this.

In dlg.lay it looked OK.

When the app was run the EditField was about 6 times as high as it should have been, 3 up/down, that was white but the text was where it should be.

I just spent a bunch of time deleting that field, replacing, changing location, etc.. It just happened when it was in the third row down.

That was about 3 or 4 months ago, maybe the U++ update fixed it as there has been no problems since then.
